ACTi SDK-10000

V1.2.40 Edition May. 2009

Table of Contents

1 Overview

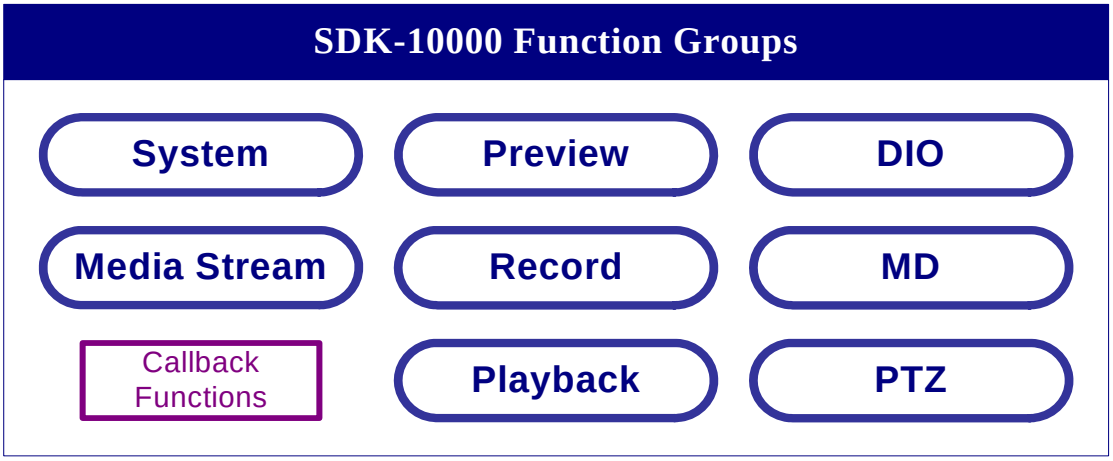
Introduction

This material covers SDK architecture, data structure and procedures to illustrate the mechanisms to integrate the IP Surveillance devices. The content of this material is designed to lead the programmers go through the flow of the SDK and design their own application with supplied functions; they are organized in topics so that programmers may find the topics they want directly.

Please refer to Programming Guide for detailed API references.

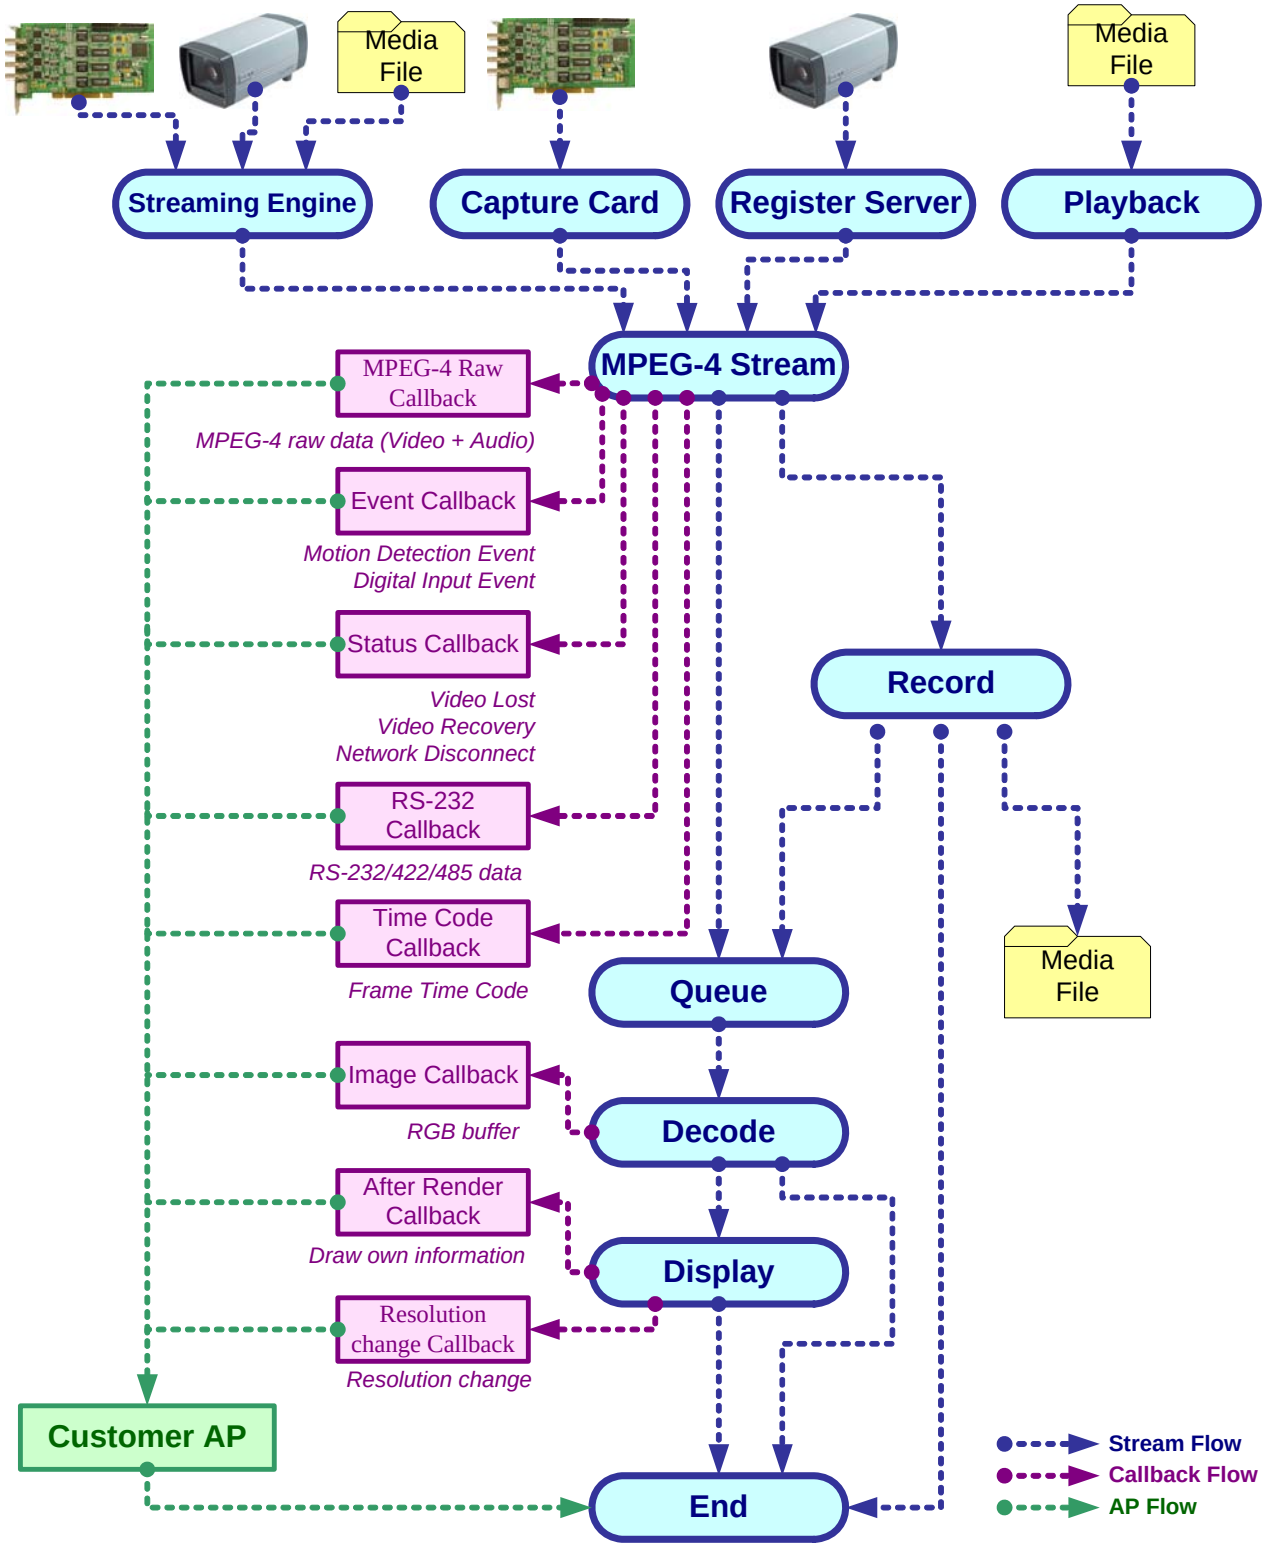
SDK Function Groups

The whole SDK can be divided into following function groups.



Architecture

SDK architecture and data flow is described as follow:



Application Type

Based on the architecture and data flow, users may develop following application type:

1. **Full-featured Surveillance system**: preview, record, playback, DIO event, MD event and PTZ functions
2. **Background recording**: record without preview. The stream can be configured as unicast or multicast mode
3. **Connection with event handling only**: connection only, wait for digital input or motion detection event; when the event triggered, then starts streaming and record the event
4. **Background recording with RGB buffer**: record without preview, receives RGB buffer to run user-defined motion detection algorithm at the same time
5. **Process MPEG-4/Motion JPEG/H.264 video stream**: advanced users may acquire video stream and process by themselves. Related video, audio and audio+video callback functions are provided
6. **User-defined information on screen**: user may use after render callback function to draw user-defined information on preview window, including OSD text, draw video intelligence information

Topics

Streaming Client Library is developed for MPEG-4/Motion JPEG/H.264 Video Network Streaming Application.

It contains following abilities:

- Registration with Unicast / Multicast
- Preview / Record / Playback
- DIO Event Handling
- Motion Detection Event Handling
- PTZ Integration
- Status Callback
- IP Quad Integration
- Advanced Topics
  - Gets Video data via Video callback function
  - Gets RGB via image callback function
  - ACTi Video Time code format
  - Decode I Frame Only
  - Save ACTi Video raw data into AVI format
  - Gets RGB via image callback function

What's New?

Following lists the new contents in this release:

v1.2

- Multiple-files playback.
- Fast file shuffle playback with index
- Auto frame rate by CPU thrash hole
- Inverse rendering image.
- New PTZ functions and absolute PTZ functions.
- Support Motion-JPEG
- Support H.264
- Support Mega-pixel mpeg4
- Jitter less function
- New Callback functions
- New Codec Type: IPP

v1.2sp1

- New chapter about H.264/RTP
- Delete all chapters about URL command. (Attach "URL Command Specification" to SDK folder instead)
- Support Dual-Stream connection.(Need Dual-Stream Devices)

SDK-10000 Key Features					
Category	Function	Files	SDK-10000		
			v1.1	v1.2	v1.2 SP1
Connection	TCP v1.0	ATCP10.dll	v	v	v
	TCP v2.0	ATCP20.dll	v	v	v
	Multicast v1.0	AMCST10.dll	v	v	v
	Multicast v2.0	AMCST20.dll	v	v	v
	Streaming Engine	ASE.dll	v	v	v
	RTP over UDP	ARTP.dll		v	v
	RTP over MCST	ARTP.dll		v	v
Resolution	Megapixel	KMPEG4.dll		v	v
H.264 Decoder	Intel IPP	IPPCodec.dll		v	v
MPEG-4 Decoder	XviD	XVIDCodec.dll	v	v	v
	FFMPEG	FFMCodec.dll	v	v	v
	Intel IPP	IPPCodec.dll		v	v
MJPEG Decoder	MJPEG Decoder	MJPEGCodec.dll		v	v
Render	GDI	DGDI.dll	v	v	v
	DirectX	DxDraw.dll		v	v
Kernel	DIO	KMPEG4.dll	v	v	v
	Motino Detection	KMPEG4.dll	v	v	v
Live View	Decode I-Frame	KMPEG4.dll	v	v	v
	Auto Drop Frame	KMPEG4.dll		v	v
	Flip	KMPEG4.dll		v	v
	Mirror	KMPEG4.dll		v	v
	Privacy Mask	KMPEG4.dll		v	v
Record	RAW format	FRAW.dll	v	v	v
	AVI format	FAVI.dll	v	v	v
	RAW + IDX format	FRAW2.dll		v	v
	Record H.264	FRAW.dll , FRAW2.dll			v
	Record MJPEG	FRAW.dll , FRAW2.dll			v
Playback	RAW format	ARAW.dll	v	v	v
	Play multiple file	AMRAW.dll		v	v
	Play H.264	ARAW.dll,AMRAW.dll			v
	Play MJPEG	ARAW.dll,AMRAW.dll			v
PTZ	PTZ Operation	PTZParser.dll	v	v	v
	Absolute Position	PTZParser.dll		v	v

Details:

(v1.2.37) Add function of KSetVideoTransferConfig, KSetMotionInfoEx, KGetMotionInfoEx.

(v1.2.37) The function of KSetTextOut is work well.

(v1.2.36)

a. Add TCPVideoStreamID to specify video track, value 0 to 255 for 1 to 256 video track.
b. Add RTPVideoTrackNumber (set it to 0, ARTP will use 1st video track, 1 to 255 is for specify video track).
c. Add RTPAudioTrackNumber (set it to 0, ARTP will use 1st audio track, 1 to 255 is for specify audio track).

(v1.2.35) ARAW has been supported time zone.

(v1.2.35) Removed VideoTrackIDOnRTP and AudioTrackIDOnRTP, and change ChannelNumber size to integer.

(v1.2.34) Removed StreamID and using ChannelNumber instead.

(v1.2.33) Handle H.264, MJpeg resolution change.

(v1.2.33) Enable Mjpeg Decode I Only (1 Frame per second).

(v1.2.31) Add KSetSmoothFastPlayback for smooth fast forward playback.

(v1.2.30) Add KGetDIOStatusByHTTPEx to request DIO status from multi-channel Devices

(v1.2.28) Support full time zones.

(v1.2.27) Support H.264, Mpeg4, Mjpeg on preview, record and playback.

(v1.2.27) Support Dual-Stream connection.(Need Dual-Stream Devices).

(v1.2.27) Replace time code by local time (default setting), to use KReplaceTimeCodeByLocalTime to enable / disable the function.

(v1.2.27) Add KDropNextPFrameTillIFrame for drop decoding of P-frames in a GOP.

(v1.2.19) Supporting 16ch preview (D1 @ 30 FPS 1.5MB bit rate)

(v1.2.18) Supporting preview, record and playback for H264 and MJpeg.

(v1.2.17) Add contact type CONTACT_TYPE_MULTIPLE_PLAYBACK for multiple playback and remote multiple playback.

(v1.2.16) Add KSetAutoDropFrameByCPUPerformance to enable auto drop frame mode. It enable a CPU thrash hole ensure dynamic frame rate.

(v1.2.16) Add KSetTimeCodeCallbackEx to call back time code in millisecond

(v1.2.16) Add KSetFirstB2Callback to call back first B2 packet

(v1.2.16) Rename KReverseImageLeftToRight to KMirrorImage.

(v1.2.16) Rename KReverseImageUpToDown to KFlipImage.

(v1.2.15) Add Multiple Files Playback functions

API :

- KSetMultipleMediaConfig
- KAddMultipleMedia
- KRemoveMultipleMedia
- KClearAllMultipleMedia
- KGetNthBeginTimeFromMultipleMedia
- KGetNthEndTimeFromMultipleMedia
- KGetTotalIFramesOfMultipleMedia
- KGetCurrentReadingFileIDFromMultipleMedia
- KGetCurrentReadingAbsTimeFromMultipleMedia

(v1.2.13) Add KPTZGetRequestAbsPTZCommand for get a PTZ command to request PTZ absolute position.

API :

- KPTZGetRequestAbsPTZCommand

(v1.2.13) Add KSetFirstB2Callabck for get the first B2 data.

API :

- KSetFirstB2Callabck

(v1.2.12) Modified the callback data of KSetDICallbackEx from int *32 to an array

(v1.2.12) Add absolute position of PTZ functions.
Two new samples demonstrate the new functions.

(v1.2.12) Add an error code value by 32 for streaming fail

(v1.2.10) Add KEnablePricavyMask for setup 3 region of privacy mask on preview

(v1.2.08) Add KSetDICallbackEx to notify DI on / off

API :

- KSetDICallbackEx

(v1.2.06) Support mega-pixel mpeg4 video.

(v1.2.06) Support mega-pixel motion jpeg video (preview only)

(v1.2.06) Add decoder mode in SDK10000, now you can use SDK10000 to decode the Mpeg4 video from IP camera.

API :

- KStartDecodeMode
- KDecodeFrame
- KStopDecodeMode.

(v1.2.06) Add Digital PTZ functions.
Digital PTZ functions.

API :

- KDigitalPTZEnable
- KDigitalPTZTo

(v1.2.06) Add Reverse image left to right function

Inverse the image while playing video stream.

API :

- KReverseImageLeftToRight
- KReverseImageUpToDown

(v1.2.06) Add Jitter less adjust function
Enable a buffer to keep down jitter of video stream.

API :

- KEnableJitterLessMode
- (v1.2.06) Increase connecting speed.

Compiling and Linking

This section describes the compiling and linking options.

Include Files ${SDK DIR}\SDK\Include

File	Description
SDK10000.h	SDK 10000 include file.

Library Files ${SDK DIR}\SDK\LIB

File	Description
KMpeg4.lib	SDK 10000 library file.
PTZParser.lib	PTZ command parser.

Runtime DLL Files ${SDK DIR}\SDK\DLL

File	Description
KMpeg4.dll	SDK Kernel dll.
ATCP10.dll	AVC adaptor on networking module for TCP 10 data.
ATCP20.dll	AVC adaptor on networking module for TCP 20 data.
AMCST10.dll	AVC adaptor on networking module for Multicast 10 data.
AMCST20.dll	AVC adaptor on networking module for Multicast 20 data.
ARTP.dll	AVC adaptor on networking module for RTP data.
ARAW.dll	AVC adaptor for playback.
AMRAW.dll	AVC adaptor for multiple files playback
DGDI.dll	GDI viewer
DxDraw.dll	DirectX viewer
FRAW.dll	File adaptor on raw data format
FAVI.dll	File adaptor on avi data format
FRAW2.dll	File adaptor on raw data format plus index
FFMCODEC.dll	MPEG-4 software CODEC
XVIDCODEC.dll	MPEG-4 software CODEC

P51CODEC.dll	MPEG-4 software CODEC
WISCODEC.dll	MPEG-4 software CODEC
IH264CODEC.dll	H.264 software CODEC
IPPCodec.dll	IPP CODEC
ipp*.dll	IPP related functions
MJPEGCODEC.dll	Motion JPEG software CODEC
PTZParser.dll	PTZ supporting functions

Sample Codes ${SDK DIR}\SDK\Samples

SDK-10000 v1.2 sample programs can be reached at **${SDK Directory}\SDK\Samples**

SDK-10000 v1.2 provides several samples:

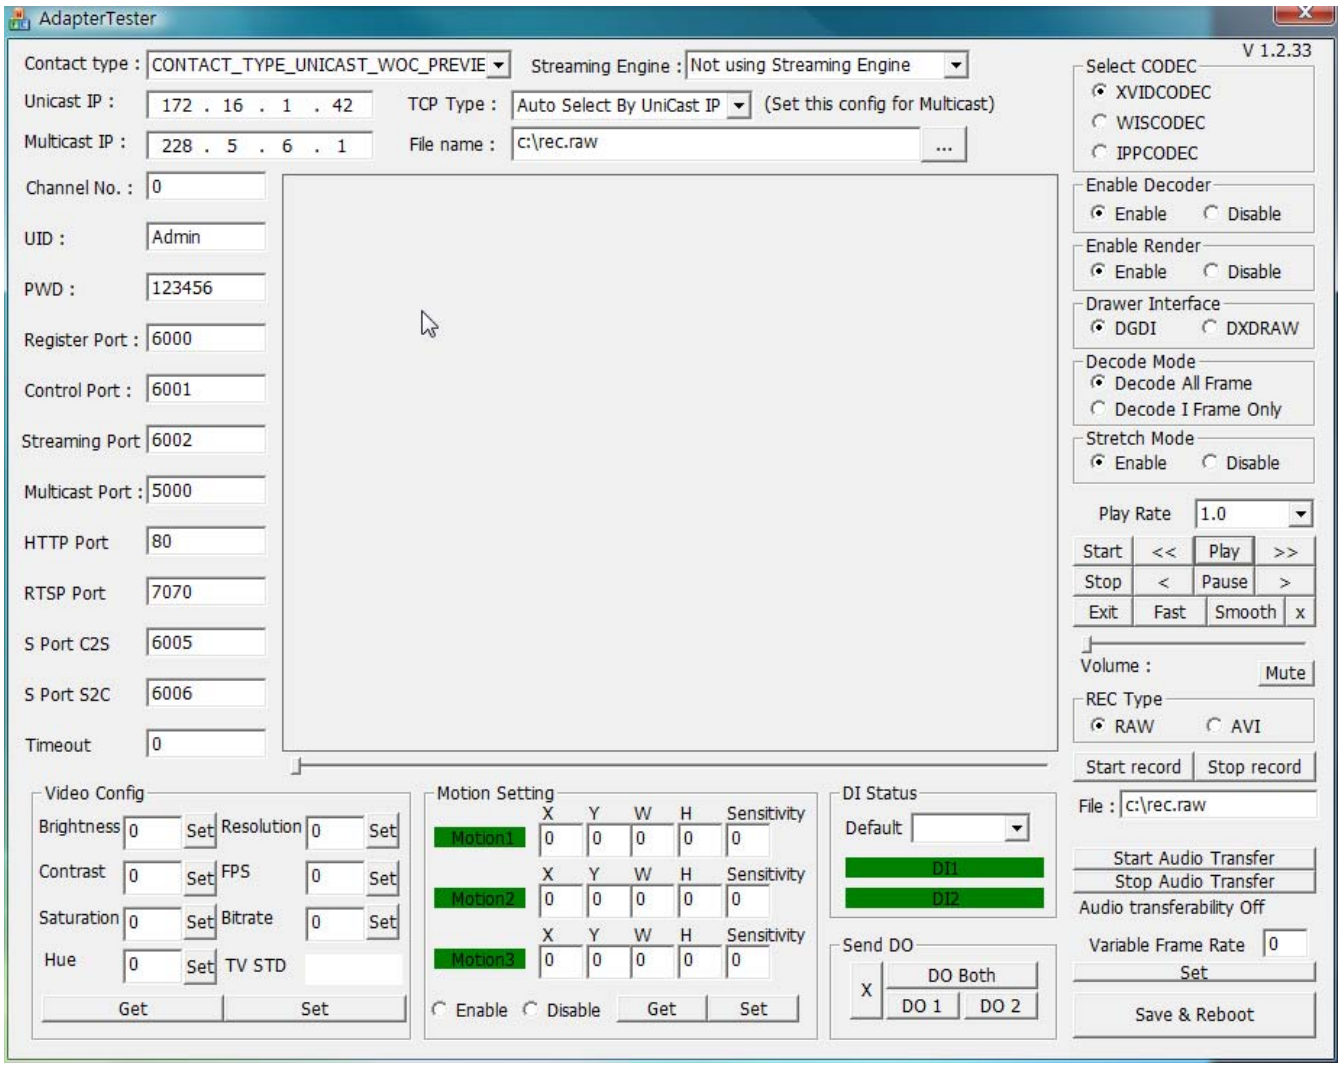
C Edition Sample Codes					
Sample Code	**Description**	VC6	VC2003	VC2005	VC2008
AbsolutePosition	Use absolute position to control PTZ Camera.	●	●	●	●
ArchivePlayer	Preview a RAW file with playback function.		●	●	●
ArchivePlayerMultiFile	Play multiple RAW file seamlessly		●	●	●
ControlSample	Setup control port connection and receive event from device directly	●	●	●	●
DecodeSample	Connects to the device receives media raw data decode MPEG4/H.264 to RGB buffer display RGB buffer Save to BMP file		●	●	●
MediaConverter	Convert RAW file to AVI format		●	●	●
PTZSample	Get PTZ command from PTZParser library Send PTZ command via URL command	●	●	●	●
RTPSample	Connects to device using RTP over UDP or RTP over Multicast Audio supported		●	●	●
StreamSample	Live view via TCP, Multicast, RTP 2-way audio, Record, Playback Motion Detection, DIO Get/Set device configuration	●	●	●	●

SearchSample	Search for connectable devices	●	●	●	●
SendAudio	Send wave file to device.	●	●	●	●
URLSample	Send URL request and receive URL response from device.	●	●	●	●

StreamSample Program

StreamSample codes demonstrate following functions:

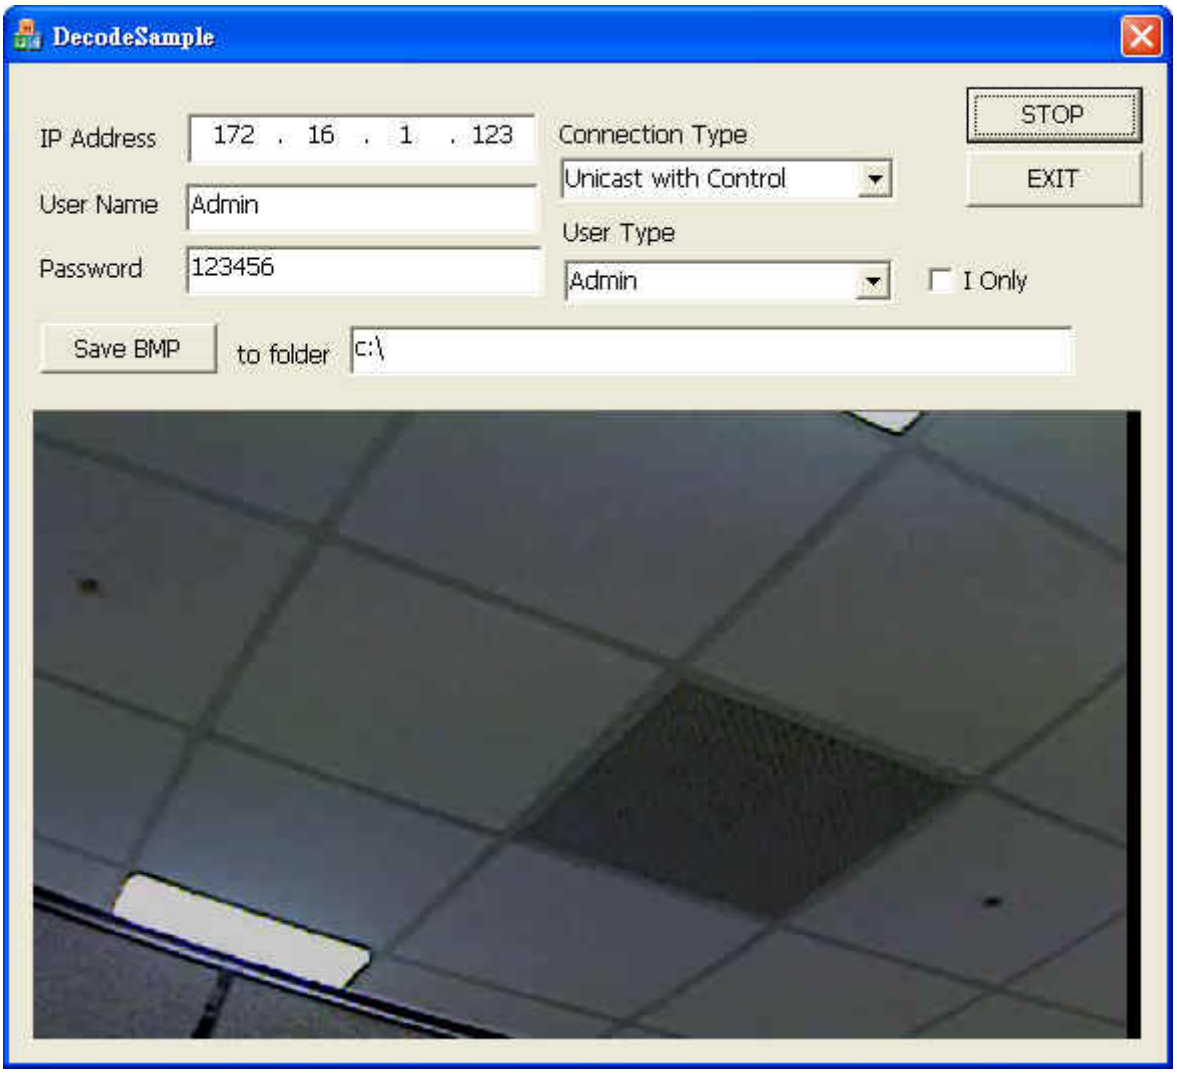
1. Search Server
2. Connection mode: unicast, multicast
3. Preview, Record
4. Motion Detection set up and trigger
5. DI trigger and sends DO
6. Audio functions



DecodeSample Program

PlaybackSample codes demonstrate following functions:

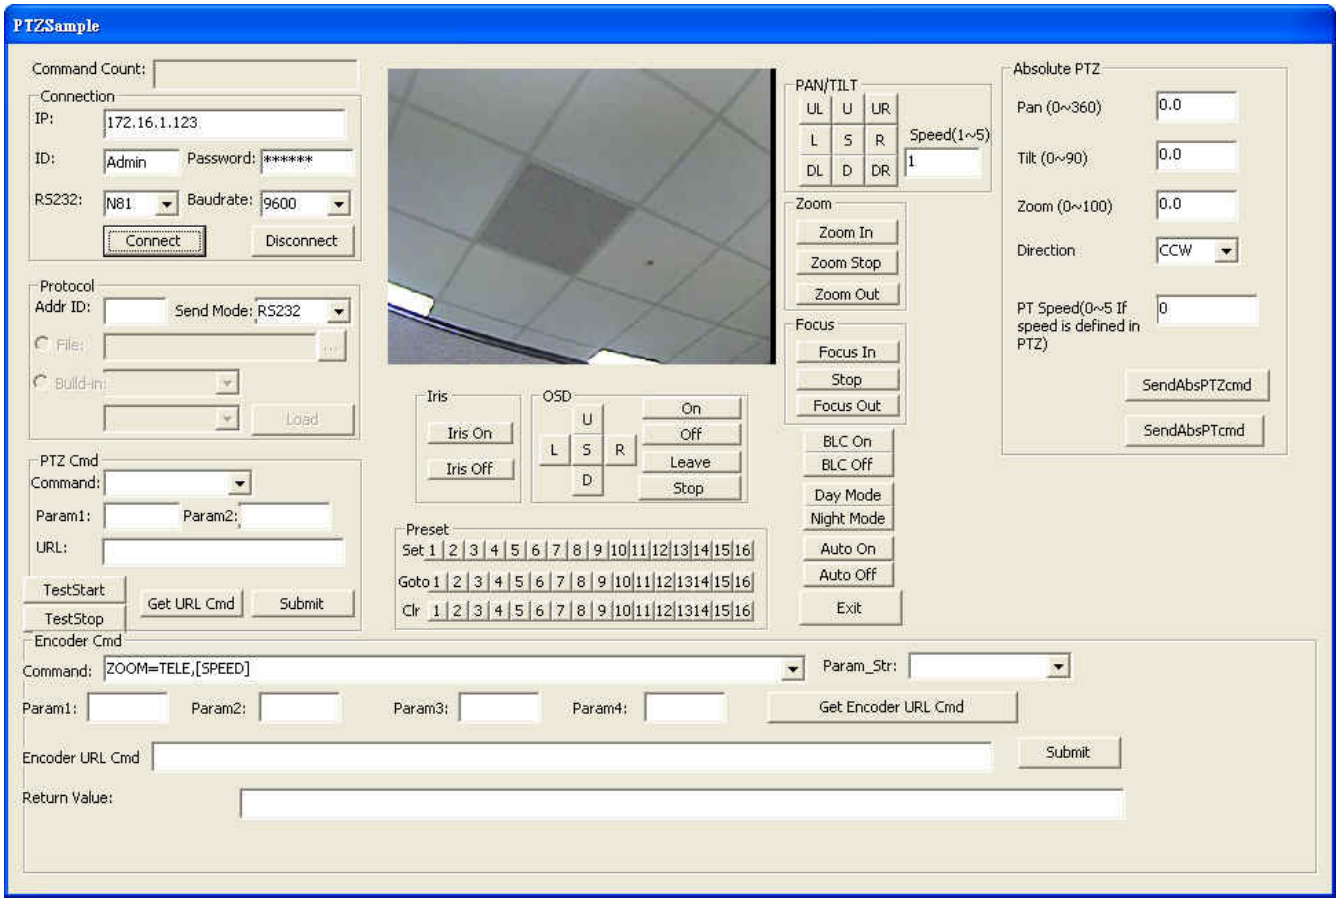
1. Decode MPEG-4/H.264 into RGB buffer
2. Display RGB buffer onto screen
3. Save RGB buffer to BMP file
4. Decode I-frame only



PTZSample Program

PTZSample codes demonstrate following functions:

1. Read PTZ protocol files
2. Operate PTZ functions.(Most PTZ functions were updated since V1.2)
3. Demonstrate Pan, Tilt, Zoom, Focus, Iris, Preset, OSD, and Absolute PTZ functions. (Absolute PTZ functions only work with DynaColor protocols now.)
4. URL Command to send PTZ commands.
5. Get PTZ command using PTZParser library. (PTZParser was integrated into SDK V1.2, so that is major change of PTZ APIs.).

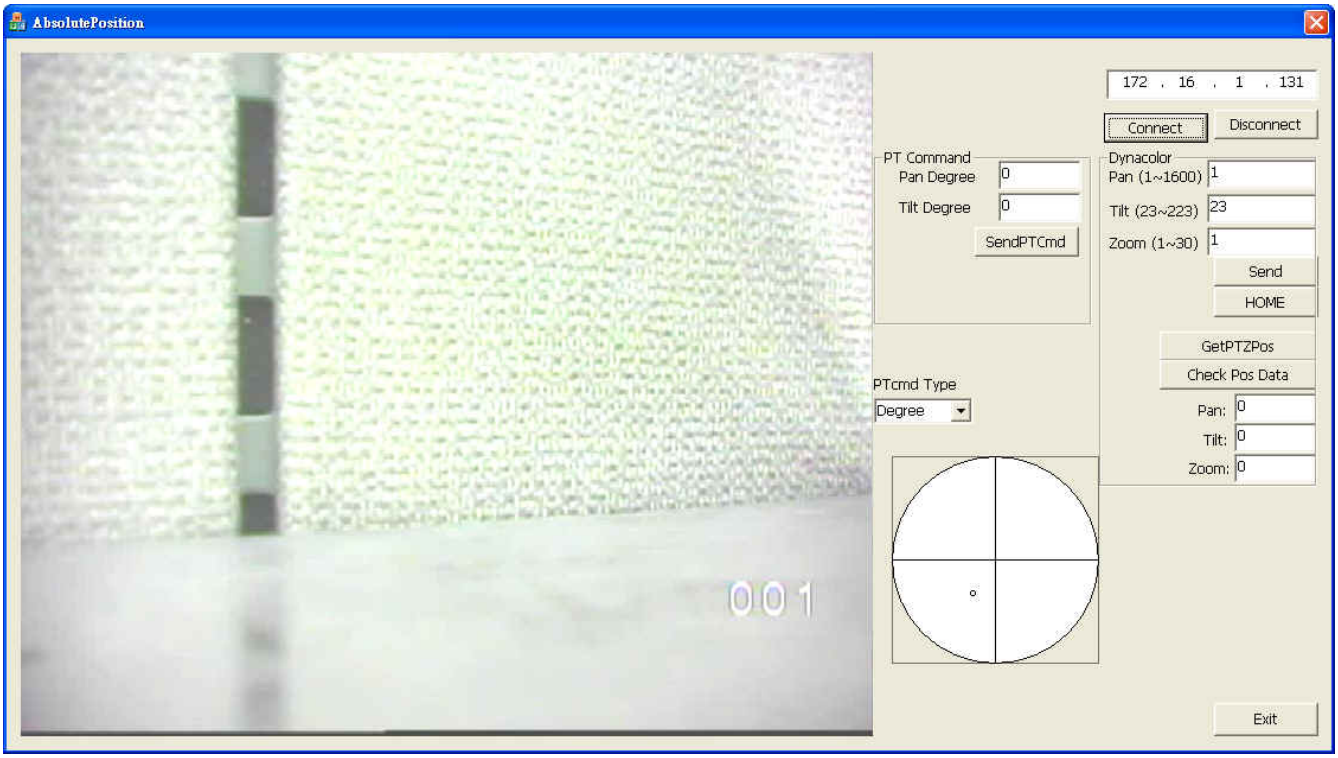


AbsolutePosition Program

AbsolutePosition codes demonstrate following functions:

1. Read PTZ protocol files
2. Operate PTZ functions.(Demonstrate Pan, Tilt, and Zoom)
3. Get current PTZ position.

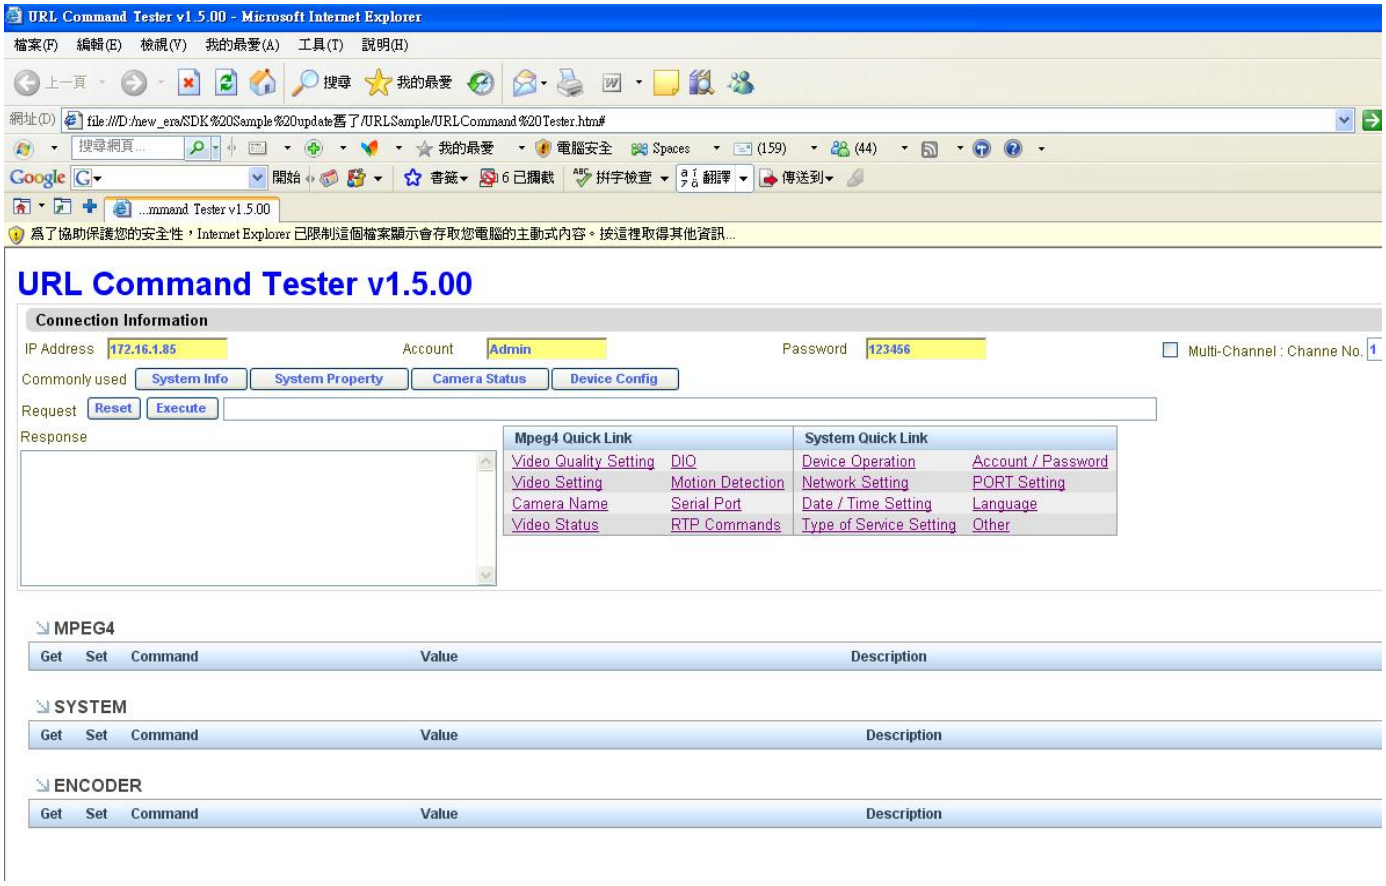
(This example works with Dynacolor protocol only.)



URLSample Program

URLSample codes demonstrate following functions:

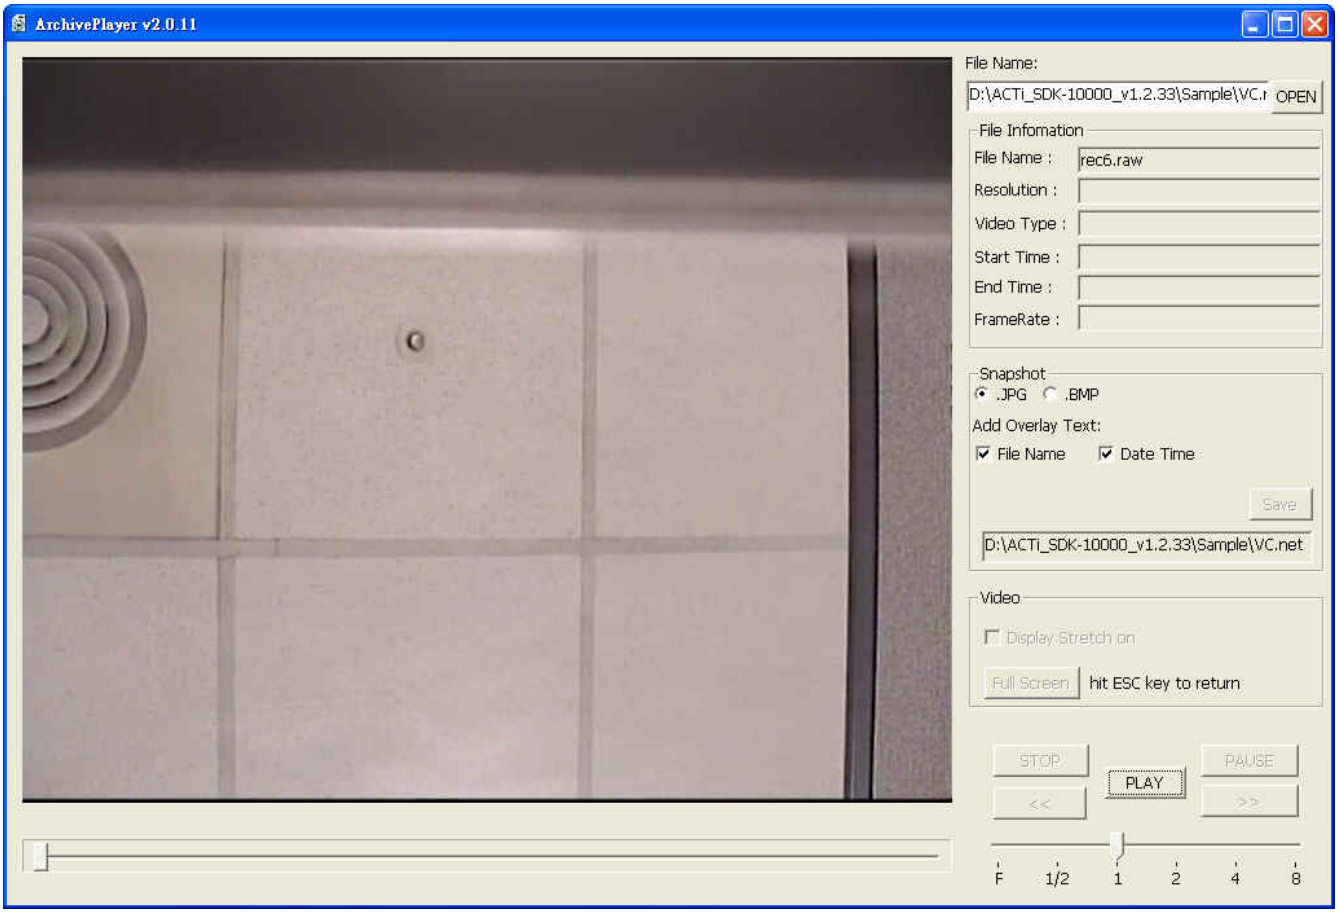
1. Send URL command request.
2. Receive URL response



ArchivePlayer Program

ArchivePlayer codes demonstrate following functions:

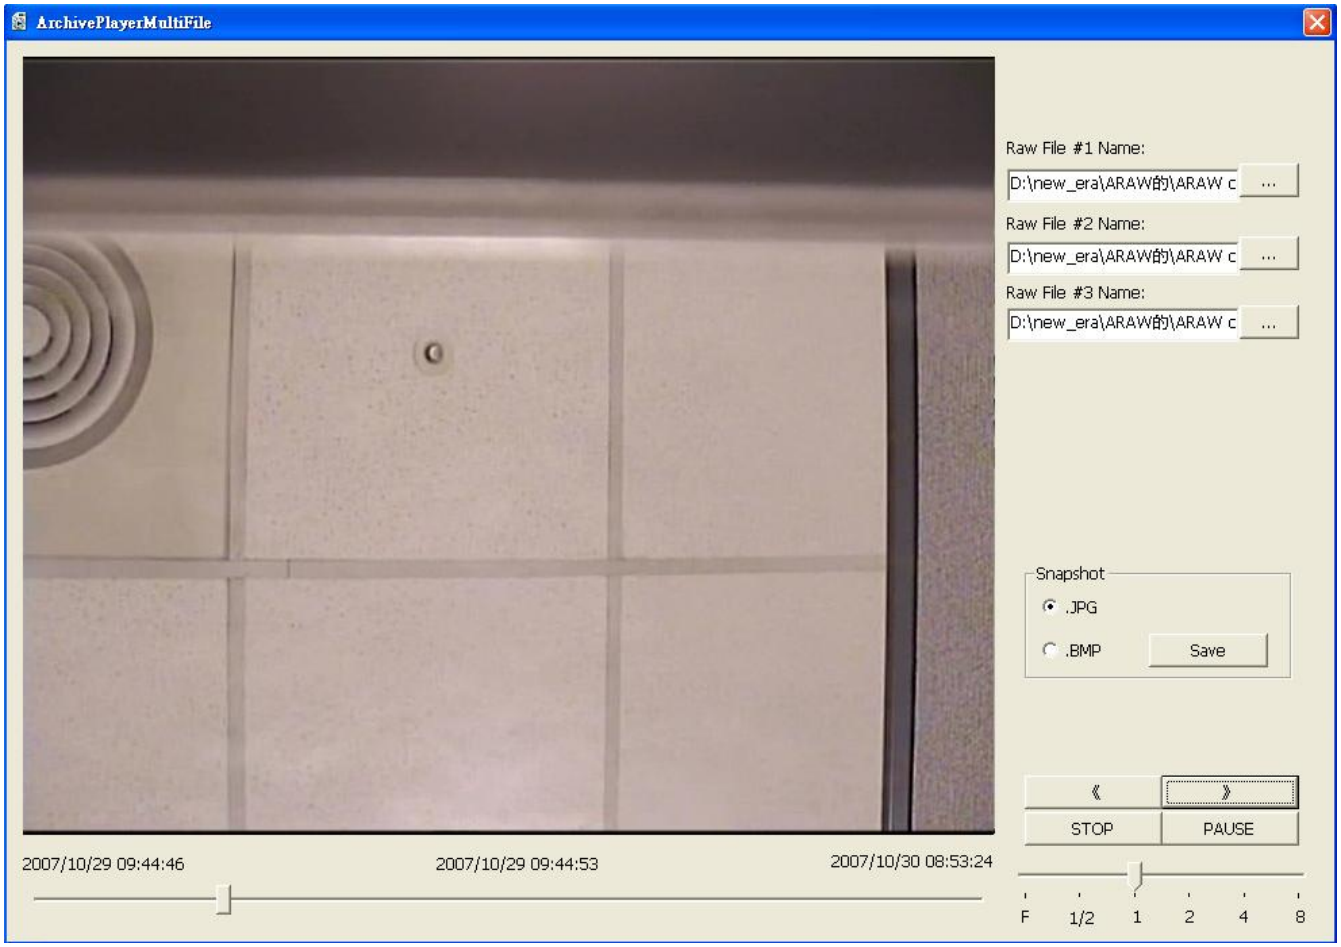
1. Snapshot with JPG&BMP format.
2. Play with different speed.
3. Preview with frame by frame.
4. Pause.
5. Seek into random position.
6. Allow to play raw/mp4 file.
7. Display text on video frame.



ArchivePlayerMultiFile Program

ArchivePlayerMultiFile codes demonstrate following functions:

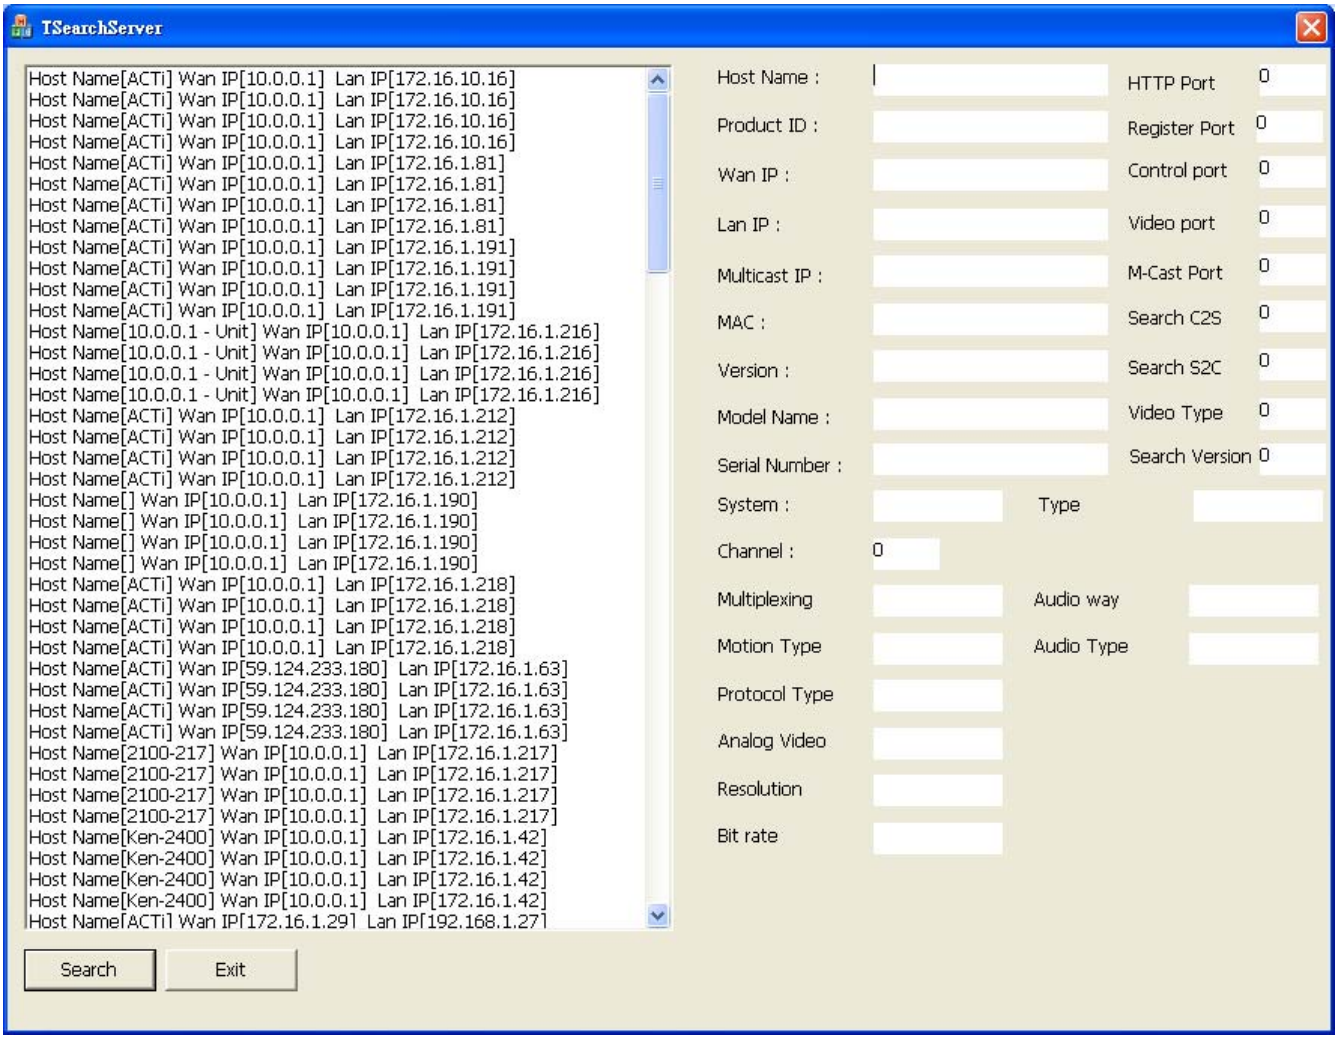
1. Snapshot with JPG&BMP format.
2. Play with different speed.
3. Preview with frame by frame.
4. Pause.
5. Seek into random position.
6. Allow to play multiple raw files seamlessly.
7. Multiple files playback only work with “raw” file and “.idx” file in pairs by now.
8. The “.idx” files can be generated by FRAW2 or IDX generator in SDK utility.



SearchSample Program

SearchSample codes demonstrate following functions:

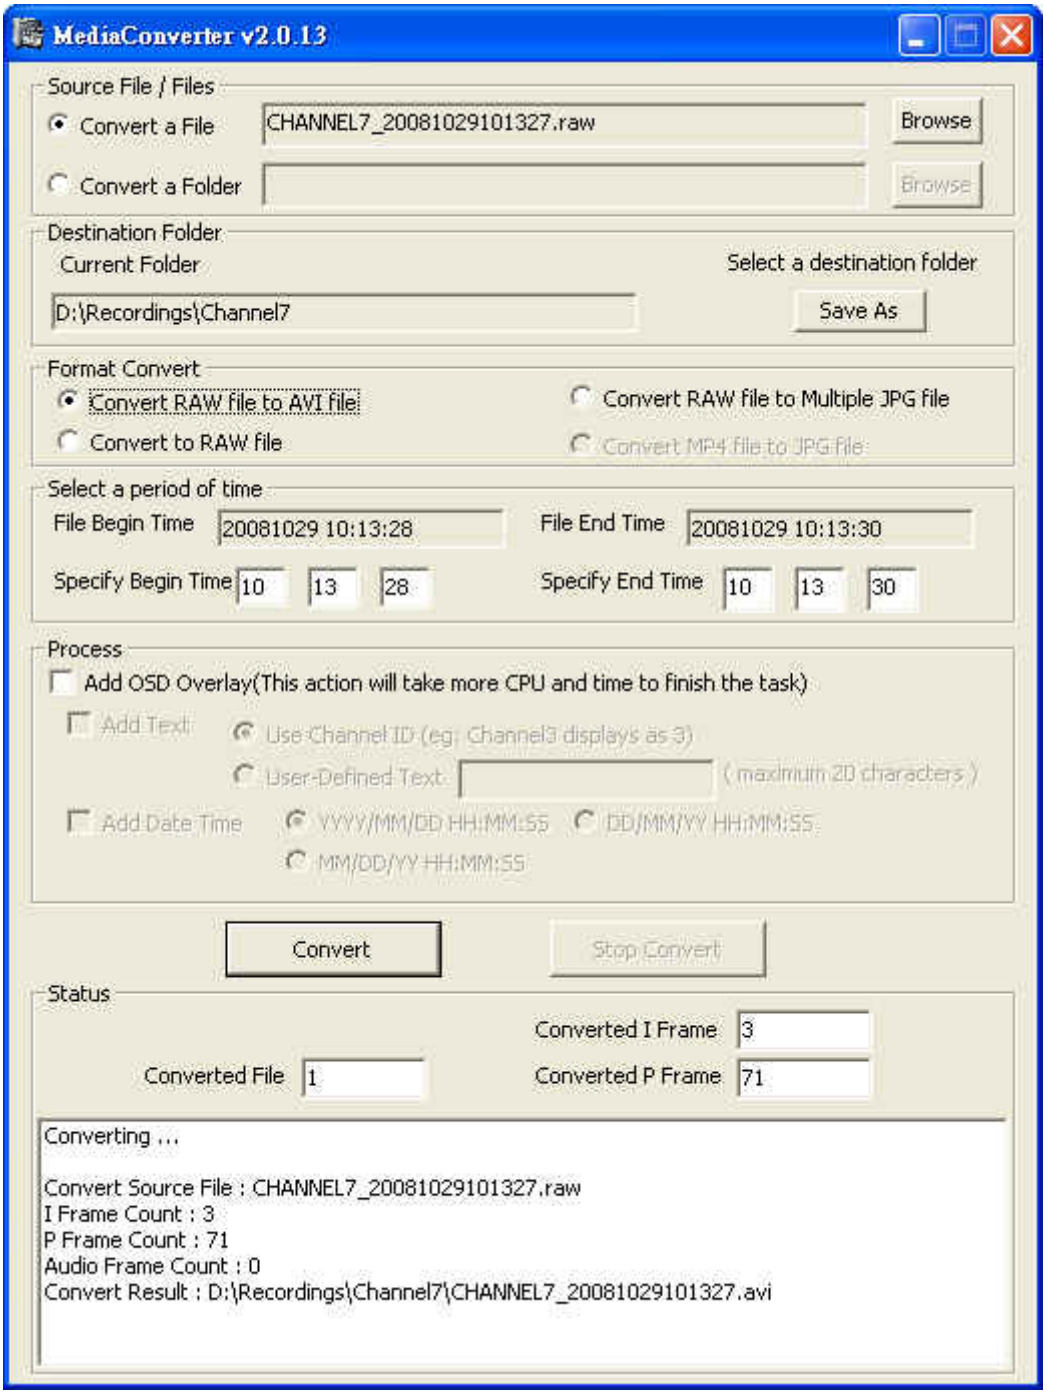
1. Search for connectable devices..



MediaConverter Program

MediaConverter codes demonstrate following functions:

1. Convert raw file to avi or multiple jpg.

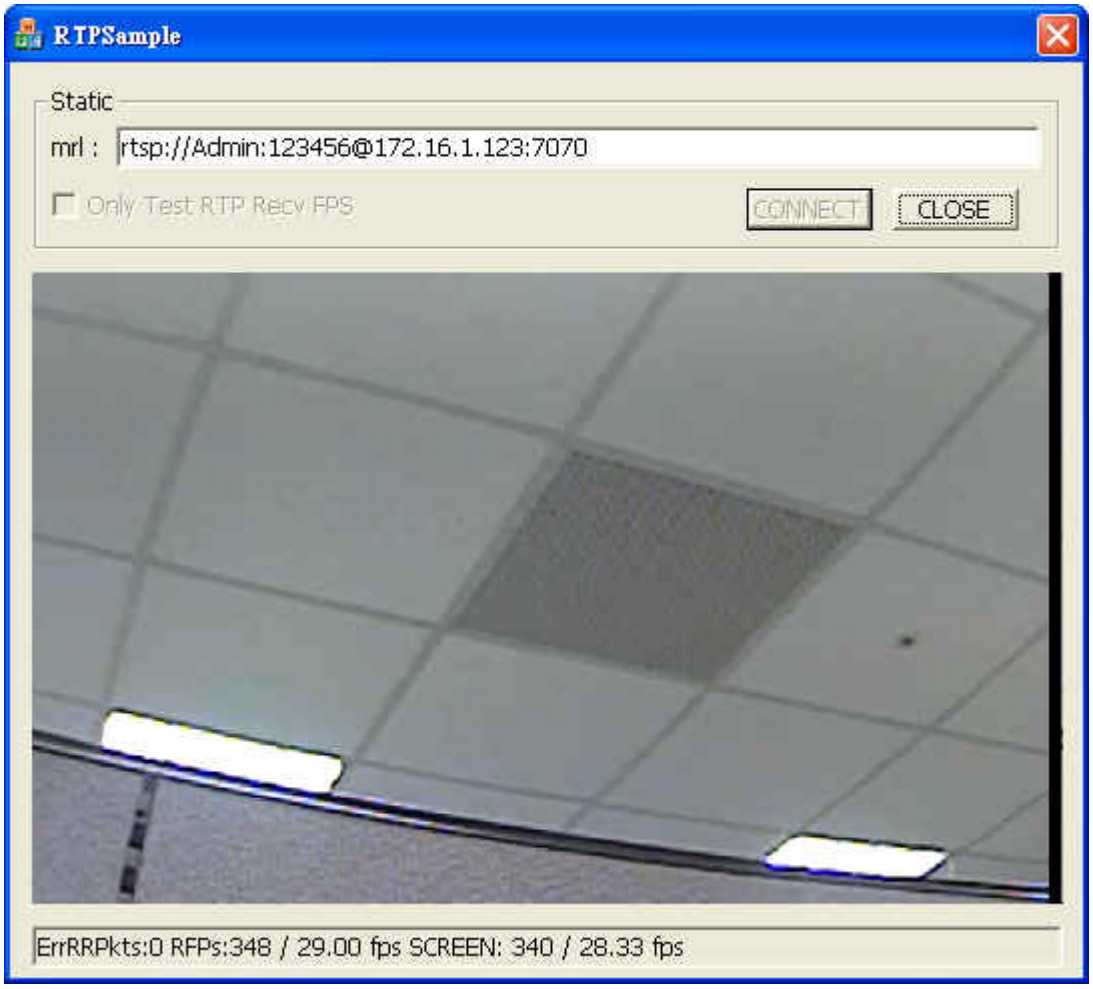


RTPSample Program

RTPSample codes demonstrate following functions:

1. Connect camera by RTP and RTSP
2. Show up RTP and RTSP transferring state.
3. Enabling “Only Test RTP Recv FPS” option will skip all pocket process.

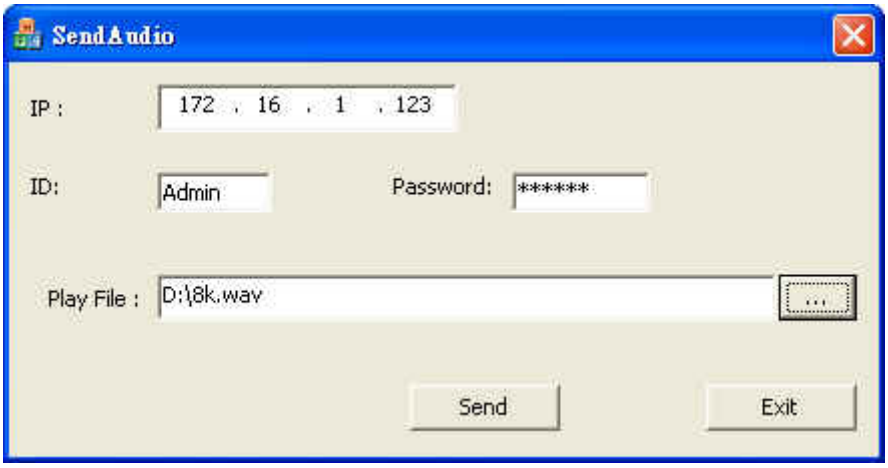
ErrRRPKts : Show error pocket number. (Including missed and wrong sequence)
RFPs : Received frames number by socket per second.
SCREEN : Processed frames number in a second.



SendAudio Program

SendAudio codes demonstrate following functions:

1. Select a pcm of 8k wave file.
2. Press send button to send audio to device.



2 Search Device

Device Locator Architecture

The section describes the mechanism on how to search ACTi's IP surveillance products on network. With this mechanism, you can locate the devices on the network, then use URL commands to operate or manage those devices.

The function sends out a broadcast message, ACTi's devices respond with detailed information, application then parse the replied information and parse the content with **NET_SEARCHSERVER** data structure.

Search Device

Steps to detect ACTi IP Surveillance products are listed as follow:

1. Call **netSearchServer()**
2. Receive and decodes with **NET_SEARCHSERVER**

NOTE: The second parameter of **netSearchServer()** indicates the maximum total number to be reached in the network; for example, if this parameter is set to 10, and there are 20 devices in the same network, then this function returns when it reaches the first 10 devices in the network.

Default timeout value is 20 seconds

```
typedef struct tagSearchServer {
    char szHostName[24];       // [OUT] Host Name         : ASCII Z STRING
    char szProductID[8];       // [OUT] ProductID         : ASCII Z STRING
    char szWanIp[16];          // [OUT] WAN IP            : ASCII Z STRING
    char szLanIp[16];          // [OUT] LAN IP       : ASCII Z STRING
    char szMultiCastIp[16];    // [OUT] MULTICAST IP      : ASCII Z STRING
    char szMac[32];            // [OUT] MAC          : ASCII Z STRING
    char cType;                // [OUT] Bit0~3       : 1: Composite, 2: S-Video
                               // [OUT] Bit4~7      : 1: Video Server, 2: IPCam
    char   dummy1;
    char   dummy2;
    char   dummy3;
    char   Version[32];
    WORD wHPort;
    WORD wSPortC2S;            // [IN]  Search   Port (Client to Server)
    WORD wSPortS2C;            // [IN]  Search   Port (Server to Client)
    WORD wRPort;               // [IN]  Register Port
```

```
    WORD wCPort;              // [IN]  Control  Port
    WORD wVPort;              // [IN]  Video   Port
    WORD wMPort;              // [IN]  MultiCastPort
    WORD   dummy4;

} NET_SEARCHSERVER;

WORD dwRet ;
NET_SEARCHSERVER ServerList[MAXSERVERLIST];
    // Receive data Structure

DWORD dwTotalNum = MAXSERVERLIST ;

dwRet = netSearchServer((char*) ServerList, &dwTotalNum);

for (DWORD i = 0; i< dwTotalNum; i++) {
    szHostName[i]     = ServerList[i].szHostName ;
        // Get the Host Name From Result Structure
    szProductID[i]        = ServerList[i].szProductID ;
        // Get the Product ID From Result Structure
    szWanIp[i]            = ServerList[i].szWanIp ;
        // Get the WanIp From Result Structure
    szLanIp[i]            = ServerList[i].szLanIp
        // Get the LanIp From Result Structure
    szMultiCastIp[i]  = ServerList[i].szMultiCastIp ;
        // Get the MultiCastIp From Result Structure
    szMac[i]          = ServerList[i].szMac ;
        // Get the Mac Address From Result Structure
    szVersion[i]      = ServerList[i].Version ;
        // Get the Firmware Version From Result Structure
    wRPort[i]             = ServerList[i].wRPort;
        // Get the Register Port From Result Structure
    wCPort[i]             = ServerList[i].wCPort;
        // Get the control Port From Result Structure
    wVPort[i]             = ServerList[i].wVPort;
        // Get the Streaming Port From Result Structure
    wMPort[i]             = ServerList[i].wMPort;
        // Get the Multicast Port From Result Structure
    wHPort[i]             = ServerList[i].wHPort;
        // Get the Http Port From Result Structure
}
```

How to detect device

This section describes how to detect, manage and configure IP devices. All commands are operated with URL Commands, you can use the functions we suggested (xmlhttp) or you can find HTTP-related functions by yourselves.

Please also refer to the Appendix for the complete ACTi URL Command listing.

System Information

Steps to detect product System Information are listed as follow:

Sample:

```
// you should get HANDLE by KOpenInterface before Preview
    HANDLE hK =  KOpenInterface();

// Prepare USER_INFO data structure by filling IP address, account, password.
    MEDIA_CONNECTION_CONFIG mcc;
// Set your connection information into struct mcc.
    …
    KSetMediaConfig(hK, &mcc);
    KConnect(hK);

    strURL = 'http://192.168.1.100:80' ;
    strURL = '/cgi-bin/system?USER=Admin&PWD=123456&SYSTEM_INFO' ;

    char szResultBuf[1024] = {0};
    DWORD dwResultLen;
    KSendURLCommand( hK, strURL, szResultbuf, dwResultLen) ;

//   Firmware Version = A1D-M2N-V2.03.02-NB
//   MAC Address = 00:0F:7C:00:1A:47
//   Production ID = SED2400-05I-1-00034
//   Factory Default Type = NTSC, Composite, Two Ways Audio (0x71)
```

System Property

Steps to detect product System Property are listed as follow:

Sample:

```
// you should get HANDLE by KOpenInterface before Preview
    HANDLE hK =  KOpenInterface();

// Prepare USER_INFO data structure by filling IP address, account, password.
    MEDIA_CONNECTION_CONFIG mcc;
// Set your connection information into struct mcc.
    …
    KSetMediaConfig(hK, &mcc);
    KConnect(hK);

    strURL = 'http://192.168.1.100:80' ;
    strURL = '/cgi-bin/system?USER=Admin&PWD=123456& SYSTEM_PROPERTY ' ;

    char szResultBuf[1024] = {0};
    DWORD dwResultLen;
    KSendURLCommand( hK, strURL, szResultbuf, dwResultLen) ;

//   SYSTEM='E'
//   TYPE='A'
//   NO_OF_CHANNEL='01'
//   MULTIPLEXING='X'
//   NO_OF_AUDIO_WAYS='2'
//   AUDIO_TYPE='PCM'
//   MOTION_TYPE='0'
//   PROTOCOL_TYPE='2'
```

Video Color Adjustments

This section describes on how to adjust video color using URL Commands.

Hue, Brightness, Contrast Setting

Steps to Gets/Sets product Video Property are listed as follow:

1. Initial **KMpeg4** Object
2. Gets color setting.
3. Set new setting

Sample:

```
typedef struct structural_MEDIA_VIDEO_CONFIG
{
DWORD dwTvStander;         ///< 0:NTSC 1:PAL
DWORD dwVideoResolution;   ///< See the definition above
DWORD dwBitsRate;          ///< See the definition above
DWORD dwVideoBrightness;   ///< 0 ~ 100 : Low ~ High
DWORD dwVideoContrast;     ///< 0 ~ 100 : Low ~ High
DWORD dwVideoSaturation;   ///< 0 ~ 100 : Low ~ High
DWORD dwVideoHue;          ///< 0 ~ 100 : Low ~ High
DWORD dwFps;               ///< 0 ~ 30 frame pre second
} MEDIA_VIDEO_CONFIG;

// you should get HANDLE by KOpenInterface before Preview
    HANDLE hK =  KOpenInterface();

// Prepare USER_INFO data structure by filling IP address, account, password.
    MEDIA_CONNECTION_CONFIG mcc;
// Set your connection information into struct mcc.
    …

    KSetMediaConfig(hK, &mcc);
    KConnect(hK);

// Get current color setting
    MEDIA_VIDEO_CONFIG mvc;
    KGetVideoConfig(hK, &mvc);
```

```
//   To Set the Video Property
     KSetHue(hK, 10)
     KSetBrightness(hK, 20);
     KSetContrast(hK, 30);
```

Video Setting Configuration

Setup Resolution, Frame Rate, Bit Rate

Steps to Gets/Sets product Video Setting are listed as follow:

Sample:

```
enum BITRATE_TYPES    /** Bitrate Types */
{
BITRATE_28K,          ///< #0# - 28K Bits per second
BITRATE_56K,          ///< #1# - 56K Bits per second
…
BITRATE_3000K         ///< #12# - 3M Bits per second
}

enum RESOLUTION_TYPES /** Resolution Types */
{
NTSC_720x480,         ///< #0# - NTSC - 720 x 480
NTSC_352x240,         ///< #1# - NTSC - 352 x 240
…
PAL_176x144           ///< #5# - PAL  - 176 x 144
}

typedef struct structural_MEDIA_VIDEO_CONFIG
{
DWORD dwTvStander;         ///< 0:NTSC 1:PAL
DWORD dwVideoResolution;   ///< See the definition above
DWORD dwBitsRate;          ///< See the definition above
DWORD dwVideoBrightness;   ///< 0 ~ 100 : Low ~ High
DWORD dwVideoContrast;     ///< 0 ~ 100 : Low ~ High
DWORD dwVideoSaturation;   ///< 0 ~ 100 : Low ~ High
DWORD dwVideoHue;          ///< 0 ~ 100 : Low ~ High
DWORD dwFps;               ///< 0 ~ 30 frame pre second
} MEDIA_VIDEO_CONFIG;

// you should get HANDLE by KOpenInterface before Preview
    HANDLE hK =  KOpenInterface();

// Prepare USER_INFO data structure by filling IP address, account, password.
    MEDIA_CONNECTION_CONFIG mcc;
// Set your connection information into struct mcc.
    …
    KSetMediaConfig(hK, &mcc);
```

```
    KConnect(hK);

// Get current color setting
    MEDIA_VIDEO_CONFIG mvc;
    KGetVideoConfig(hK, &mvc);

//  To Set the Video Property
    KSetResolution(hK, 10)    // 0~5
    KSetFPS(hK, 30);
    KSetBitRate(hK, 30);      // 0~12
```

Save and Reboot

The section describes the mechanism on how to search ACTi's IP surveillance products on network. With this mechanism, you can locate the devices on the network, then use URL commands to operate or manage those devices.

The function sends out a broadcast message, ACTi's devices respond with detailed information, application then parse the replied information and parse the content with **NET_SEARCHSERVER** data structure.

Execute Save and Reboot Command

Steps to execute Save and Reboot Video device are listed as follow:

Sample:

```
// you should get HANDLE by KOpenInterface before Preview
    HANDLE hK =  KOpenInterface();

// Prepare USER_INFO data structure by filling IP address, account, password.
    MEDIA_CONNECTION_CONFIG mcc;
// Set your connection information into struct mcc.
    …
    KSetMediaConfig(hK, &mcc);
    KConnect(hK);

    KSaveReboot(hK);
```

3 Preview / Record / Playback

Preview / Record Architecture

This material covers SDK architecture, data structures and sample programs to illustrate the methods to integrate ACTi's IP Surveillance products.

Register to IP devices

Steps to register to ACTi's device:

1. Call **`KOpenInterface()`** to get KMpeg4 handle.
2. Prepare IP address, port number, account, password, contact type..
3. Call **`KSetMediaConfig(HANDLE, MEDIA_CONNECTION_CONFIG)`** to set connect config.
4. Call **`KConnect(HANDLE).`**
5. Call **`KStartStreaming(HANDLE)`** to get ready to receive.

```
// you should get HANDLE by KOpenInterface before Preview
    HANDLE hK = KOpenInterface();

// Set call back functions
    KSetRawDataCallback(hK, id, fnRawCallback);

// Prepare USER_INFO data structure by filling IP address, account, password.
    MEDIA_CONNECTION_CONFIG mcc;
// Set your connection information into struct mcc.
    …
    KSetMediaConfig(hK, &mcc);
    KConnect(hK);

// Start Streaming
    KStartStreaming(hK);
```

Dual stream devices and multi channel devices

Choose stream or channel number

Steps to register to ACTi's device:

1. Call **`KOpenInterface()`** to get KMpeg4 handle.
2. Prepare IP address, port number, account, password, contact type..
3. Set ChannelNumber in MEDIA_CONNECTION_CONFIG structure.
4. Call **`KSetMediaConfig(HANDLE, MEDIA_CONNECTION_CONFIG)`** to set connect config.
5. Call **`KConnect(HANDLE).`**
6. Call **`KStartStreaming(HANDLE)`** to get ready to receive.

```
// you should get HANDLE by KOpenInterface before Preview
    HANDLE hK = KOpenInterface();

// Set call back functions
    KSetRawDataCallback(hK, id, fnRawCallback);

// Prepare USER_INFO data structure by filling IP address, account, password.
    MEDIA_CONNECTION_CONFIG mcc;
// Set your connection information into struct mcc.
    mcc.ChannelNumber = 3; //(Select channel no.4 in a multi channel device )
    …
    KSetMediaConfig(hK, &mcc);
    KConnect(hK);

// Start Streaming
    KStartStreaming(hK);
```

Variable Frame Rate and Multi-Stream

Choose stream or channel number

When the device is set on variable frame rate mode, the device is able to send variable frame rate with different TCP session.

Create multiple handles to connect devices:

1. Call **`KOpenInterface()`** to get KMpeg4 handles.
2. Prepare IP address, port number, account, password, contact type..
3. Set ChannelNumber in MEDIA_CONNECTION_CONFIG structure.
4. Call **`KSetMediaConfig(HANDLE, MEDIA_CONNECTION_CONFIG)`** to set connect config.
5. Call **`KConnect(HANDLE).`**
6. Call **`KStartStreaming(HANDLE)`** to get ready to receive.
7. Call **`KSetVariableFPS(HANDLE,dwFPS)`** to set different streaming FPS.

```
// you should get HANDLEs by KOpenInterface
    HANDLE hK1 = KOpenInterface();
    HANDLE hK2 = KOpenInterface();

// Prepare USER_INFO data structure by filling IP address, account, password.

// Set your connection information into struct mcc.
    …

// Start Streaming
    KStartStreaming(hK1);
    Kplay(hk2);

    KSetVariableFPS(hk1, 1);
    KSetVariableFPS(hk2, 30);
```

Preview Operations

Preview with Unicast Mode

Steps to start preview with unicast mode include:

1. Set contact type as **`CONTACT_TYPE_UNICAST_PREVIEW`**;
2. Register to the IP devices
3. Call **`KPlay(HANDLE)`** to start receive data.

```
// you should get HANDLE by KOpenInterface before Preview
    HANDLE hK =  KOpenInterface();

// Set call back functions
    KSetRawDataCallback(hK, id, fnRawCallback);

// Prepare USER_INFO data structure by filling IP address, account, password.
    MEDIA_CONNECTION_CONFIG mcc;
// Set your connection information into struct mcc.
    mcc.ContactType = CONTACT_TYPE_UNICAST_PREVIEW;
    …
    KSetMediaConfig(hK, &mcc);
    KConnect(hK);

// Start Streaming
    KStartStreaming(hK);
// Start receiving data from KMpeg4
    KPlay(hK);
```

Preview with Audio

Steps to register to ACTi's device:

1. Call **`KOpenInterface()`** to get KMpeg4 handle.
2. Prepare IP address, port number, account, password, contact type..
3. Call **`KSetMediaConfig(HANDLE, MEDIA_CONNECTION_CONFIG)`** to set connect config.
4. Call **`KConnect(HANDLE).`**
5. Call **`KStartStreaming(HANDLE)`** to get ready to receive.
6. Call **`KPlay(HANDLE)`** to start receive data.
7. Set mute mode to false with **`KSetMute(HANDLE, BOOL)`** function
8. Set audio volume with **`KSetVolume(HANDLE, int, int)`** function

NOTE:

```
/
// Register to the device
// Start Preview

//---- Set volume
    KSetVolume( hK , lLeftVolume , lReightVolume );  // set volume

//---- set to mute
    KSetMute(hK, true);        // audio is off

//---- turn audio back on
    KSetMute(hK, false);       // audio is on
```

Preview with 2-way audio

Steps to preview with 2-way audio include:

1. Call **`KOpenInterface()`** to get KMpeg4 handle.
2. Prepare IP address, port number, account, password, contact type..
3. Call **`KSetMediaConfig(HANDLE, MEDIA_CONNECTION_CONFIG)`** to set connect config.
4. Call **`KConnect(HANDLE).`**
5. Call **`KStartStreaming(HANDLE)`** to get ready to receive.
6. Call **`KPlay(HANDLE)`** to start receive data.
7. Start preview
8. Get Audio Token
9. Send audio sound from PC side to the device with **`KStartAudioTransfer(HANDLE)`** function. This function opens the speaker connected on the PC, and grab sound from the speaker and transmit to the device
10. Stop sending audio sound from PC side to the device with **`KStopAudioTransfer(HANDLE)`** function

IMPORTANT: One IP device has only 1 audio token; if the token is taken by one application, then no other application may acquire the audio token again. Remember to free audio token after the 2-way audio function is done.

```
// Register to the device

// Get the Audio Token
    bool bAudioToken = KGetAudioToken( hK );

// check the return value , if you get the audio token success.
    if ( bAudioToken )
    {
        KStartAudioTransfer(hK);
// start sending audio from PC to the device
// this function turns on speaker, the audio will be captured
// and transferred to the devices
    }
    KStopAudioTransfer(hK);
// Free the Audio Token Before you close connection.
    KFreeAudioToken(hK);
```

Preview with I-Frame Decoding only

This chapter describes a mechanism on how to decrease CPU loading. With this mechanism, MPEG-4 software decoder will decode I-Frame only and drops all P-Frame before decoding.

Steps to preview with I-Frame decoding only include:

1. Register to the IP device
2. Preview with **`KPlay(HANDLE)`**
3. Set to I-Frame decoding only with **`KSetDecodeIFrameOnly(HANDLE, BOOL)`** function

NOTE: With **`KSetDecodeIFrameOnly(HANDLE, BOOL)`** function, the CPU loading can be decreased dramatically.

IMPORTANT: **`KSetDecodeIFrameOnly(HANDLE, BOOL)`** function only affects preview and CPU loading; recording still records with I-frame and P-frame as setup.

```
// you should get HANDLE by KOpenInterface and Start Preview First
    KPlay(hK);

// [1] If you are handling raw data yourself by using call back function then you
//     have to filter the frames and decide which frame your are going to process.
//     This is because KMpeg4 will pass all the frames to call back function.

// Determine the frame type I or P frame.

    If (!bDecodeI )
    {
        // Decode All of Frames you receive
    } else {
        // Check the frame type
        // Decode I Frame Only
    }

//-------------------------------------------------------------------------

// [2] If KMpeg4 is handling the raw data for you then you can call
//     KSetDecodeIFrameOnly(HANDLE, BOOL) to decode I frame only
    KSetDecodeIFrameOnly(hK, true);
```

Draw your own information on the preview window

This chapter describes a mechanism on how you can draw your own information on the preview window, including OSD information, timecode or video intelligence information.

Steps to draw your own information on the preview window:

1. Register to the IP device
2. Setup after render callback function (**`KSetAfterRenderCallback()`**)
3. When preview window is painted, SDK will calls after render callback function
4. Draw your own information in the after render callback function

NOTE: When you hook up **`KSetAfterRenderCallback()`** function, the callback function will be called 30 times per second, if the frame rate is set to 30 FPS.

```
/
// register to the device

// Setup after render callback function
    KSetAfterRenderCallback( hK, dwCallbackID, AfterRenderCallback );

AfterRenderCallback(DWORD dwCallbackID)
{
//---- draw your own information over here,
//    including OSD, time code or video intelligence information
}
```

Record Operations

Background record with multicast mode

Streaming Client Library is developed for Video Network Streaming Application.

Steps to start preview with multicast mode without preview include:

1. Set Contact type as **`CONTACT_TYPE_MULTICAST_PREVIEW`** or **`CONTACT_TYPE_MULTICAST_WOC_PREVIEW`**
2. Register to the IP devices
3. Start recording

NOTE: Application may start recording without preview.

```
/
// Get KMpeg4 handle
     HANDLE hK =  KOpenInterface();

// Prepare USER_INFO data structure by filling IP address, account, password.
     MEDIA_CONNECTION_CONFIG mcc;
// Set your connection information into struct mcc.
     mcc.ContactType = CONTACT_TYPE_MULTICAST_PREVIEW;
     …
     KSetMediaConfig(hK, &mcc);
     KConnect(hK);

// Start Streaming
     KStartStreaming(hK);
// Start receiving data from KMpeg4
     KPlay(hK);

// Start recording with record file name.
     KStartRecord(hK, “c:\\rec.raw”);

// Finish recording
// You can retrive the recording information by passing MP4FILE_RECORD_INFO
     MP4FILE_RECORD_INFO mri;
     KStopRecord(hK, &mri);
```

Alarm Recording with DI event

Steps to start alarm recording include:

1. Setup pre-event recording time and post-event recording time
2. Register to the IP devices
3. Setup event callback
4. Start alarm recording
5. Stop alarm recording

```
// Setup digital input callback function
    KSetDICallback( hK, dwCallbackID, DIOCallback );

    KSetPrerecordTime(hK, 5);      // set pre-event time as 5 seconds

// Register to the device

//----- in call back function

DIOCallback(DWORD dwCallbackID, bool bDI1, bool bDI2 )
{
    if ( bDI1 || bDI2)        //---- DI 1 or DI 2 is on
    {
        KStartRecord (hK, "C:\\AlarmREC.raw" );
        Sleep( 10000 );           // records for 10 seconds
        KStopRecord( hK, NULL );  // in total it records 15 seconds
    }
}
```

Playback Operations

Steps to operate playback functions include:

1. Call **KOpenInterface()** to get KMpeg4 handle.
2. Prepare file name and set contact type to **CONTACT_TYPE_PLAYBACK**
3. Call **KSetMediaConfig(HANDLE, MEDIA_CONNECTION_CONFIG)** to set connect config.
4. Call **KConnect(HANDLE).**
5. Call **KStartStreaming(HANDLE)** to get ready to receive.
6. Call **KPlay(HANDLE)** to start receive data.
7. Sets playback play speed
8. Calls playback operation, including play forward, play backward, seed operation
9. If you want to play multiple files seamlessly, Call **KSetMultipleMediaConfig(HANDLE, MEDIA_CONNECTION_CONFIG)** instead of step 3.

Open and close a raw data file

```
// Get KMpeg4 SDK handle
    HANDLE hK =  KOpenInterface();

// Prepare playback file name.
    MEDIA_CONNECTION_CONFIG mcc;
// Set your connection information into struct mcc.
    mcc.ContactType = CONTACT_TYPE_PLAYBACK;
    strcpy(mcc.PlayFileName, “c:\\test.raw”);
    …
    KSetMediaConfig(hK, &mcc);
// Open file.
    KConnect(hK);
// Start Streaming
    KStartStreaming(hK);

// Stop streaming
    KStopStream( hK );
// Close file
    KDisconnect( hK );
```

Play forward, backward

```
// Get KMpeg4 SDK handle
     HANDLE hK =  KOpenInterface();

// Set render information.
     MEDIA_RENDER_INFO mri;
     mri.RenderInterface = DGDI;
     mri.hWnd = m_hWnd;             // Windows' handle to draw
     mri.rec = m_rec;               // rec information.
     KSetRenderInfo(hK, &mri);

// Prepare playback file name.
     MEDIA_CONNECTION_CONFIG mcc;
// Set your connection information into struct mcc.
     mcc.ContactType = CONTACT_TYPE_PLAYBACK;
     strcpy(mcc.PlayFileName, "c:\\test.raw");
     …
     KSetMediaConfig(hK, &mcc);
// Open file.
     KConnect( hK );
// Start Streaming
     KStartStreaming(hK);
// Play forward
     KPlay( hK );

// Play backward
     KSetPlayDirection(hK, false);
```

Play frame by frame

```
// Play step by step

// Open file and play
   ...

// need to set play status pause for play step frame
     KPause(hK);

// Step to next frame
     KStepNextFrame(hK);

// Step to previous frame
     KStepPrevFrame(hK);
```

Play multiple files seamlessly

```
// Get KMpeg4 SDK handle
     HANDLE hK =  KOpenInterface();

// Prepare playback file name.
     MEDIA_CONNECTION_CONFIG mcc;
// Set your connection information into struct mcc.
     mcc.ContactType = CONTACT_TYPE_PLAYBACK;

     …
//Use KSetMultipleMediaConfig() to enable “Multiple Media” functions.
     KSetMultipleMediaConfig(m_hKMpeg4 , &m_mcc);

// add files.
     KAddMultipleMedia( m_hKMpeg4, 1, filename)
     KAddMultipleMedia( m_hKMpeg4, 3, filename2)
     KAddMultipleMedia( m_hKMpeg4, 5, filename3)
     …
     KConnect(hK);
// Start Streaming
     KStartStreaming(hK);

// Stop streaming
     KStopStream( hK );
// Close file
     KDisconnect( hK );
```

4 Event Handling

Digital I/O Architecture

This material covers SDK architecture, data structure and sample programs to illustrate the methods to integrate ACTi's IP Surveillance products.

Receives Digital Input Event

Steps to receive digital input event include:

1. Register to the IP devices
2. Setup digital event callback
3. Process digital input event in the callback function

```
// Get Mpeg4 SDK handle
// Setup digital input callback function
    KSetDICallback( hK, dwCallbackID, DICallback );

    KSetPrerecordTime(hK, 5);      // set pre-event time as 5 seconds

// Register to the device

//----- in call back function

DICallback( DWORD dwCallbackID, bool bDI1, bool bDI2 )
{
    if ( bDI1 || bDI2 )        //---- DI 1 or DI 2 is on
    {
        KStartRecord (hK, "C:\\AlarmREC.raw" );
        Sleep( 10000 );            // records for 10 seconds
        KStopRecord( hK, NULL );   // in total it records 15 seconds
    }
}
```

Send Digital Output

Steps to receive digital input event include:

1. Register to the IP devices
2. Call **`KSendDO(HANDLE, BYTE)`** function to send event to the digital output device

Send DO 1

```
// Register to device.

#define DO_OUTPUT_1   0X01
#define DO_OUTPUT_2   0X02

// Send DO 1
     KSendDO( hK, DO_OUTPUT_1);
```

Send DO 2

```
// Register to device.

// Send DO 1
     KSendDO( hK, DO_OUTPUT_2);
```

Motion Detection Event Handling

Sets Motion Detection parameters

Steps to setup motion detection parameters include:

1. Register to the IP devices
2. Setup motion detection callback function
3. Sets motion detection parameters
4. Process motion detection event in the callback function

NOTE: The parameter to set the range of the motion detection window has to be the multiplier of 16, if not, the number will be aligning to the multiplier of 16. For example, if the application set the range as 125, then it will be align to 128.

3

Set MD Range to Range1

```
typedef struct structural_MEDIA_MOTION_INFO
{
DWORD dwEnable;
DWORD dwRangeCount;
DWORD dwRange[3][4];
DWORD dwSensitive[3]; ///< 0 – 100
} MEDIA_MOTION_INFO;

// Register to the IP devices

// Prepare you own callback function

// Plug function after KOpenInterface()
    KSetMotionDetectionCallback(hK, dwCallbackID, MDCallBack);

// Set motion detection structure
    MEDIA_MOTION_INFO mmi;
    mmi.dwEnable = 1;                   // Enable MD
    mmri.dwRangeCount = 1;              // Just 1 range for MD
    mmi.dwSensitive[0] = 100;           // Sensitive of range 1
    mmi.dwRange[0][0] = 0;              // Left position
    mmi.dwRange[0][1] = 0;              // Top position
    mmi.dwRange[0][2] = 128;            // Width of range 1
    mmi.dwRange[0][3] = 128;            // Height of range 1

// Set motion detection information.
    KSetMotionInfo( hK, mmi);
```

Gets Motion Detection Settings

Get MD Range Setting

```
//Prepare structure for get MD information
     MEDIA_MOTION_INFO mmi;

// One function to get all data
     KGetMotionInfo(hK, &mmi);
```

Receives Motion Detection Trigger Event

To Plug You Own Callback Function for MD

```
Void MDCallBack(DWORD dwCallbackID, bool bMotion1, bool bMotion2, bool bMotion3)
{
     if( bMotion1 )
     {
// Motion 1 Event occuring
     }

     if( bMotion2 )
     {
// Motion 2 Event occuring
     }

     if( bMotion3 )
     {
// Motion 3 Event occuring
     }
}
```

Status Callback – video lost, recovery, disconnect event

Status callback includes:

1. Video Lost event
2. Video Recorvery event
3. Network disconnect event

Steps to implement status callback are listed as follow:

1. Register to the device
2. Setup appropriate callback function (**KSetVideoLossCallback(), KSetVideoRecoveryCallback(), KSetNetworkLossCallback()**)
3. Event handling in the status callback function

```
//---- prepare status callback here
// Video lost
void VideoLossCallBack(DWORD dwCallbackID)
{
// To Do: Add your video loss handle code here.
}

// Video recovery
void VideoRecoveryCallBack(DWORD dwCallbackID)
{
// To Do: Add your video recovery handle code here.
}

// Disconnect
void NetworkLossCallback(DWORD dwCallbackID)
{
// To Do: Add your network loss handle code here.
}

//---- register to the server
// Set video loss call back
    KSetVideoLossCallback( hK, dwCallbackID, VideoLossCallBack);
```

```
// Set video recovery call back
    KSetVideoRecoveryCallback( hK, dwCallbackID, VideoRecoveryCallBack);

// Set network loss (disconnect) call back
    KSetNetworkLossCallback(hK, dwCallbackID, NetworkLossCallback);
```

5 PTZ Integration

PTZ Integration Architecture

This material covers how to integrate PTZ protocol with prepared information.

In the product architecture, the PTZ operation is defined as transparent tunnel; in this way, the PTZ protocol information does not keep in the firmware, and user's application has to parse and prepare PTZ commands in the application side.

To shorten the integration process, SDK provides implemented and tested PTZ protocol files, so that application may just utilize the PTZ protocols that has been prepared.

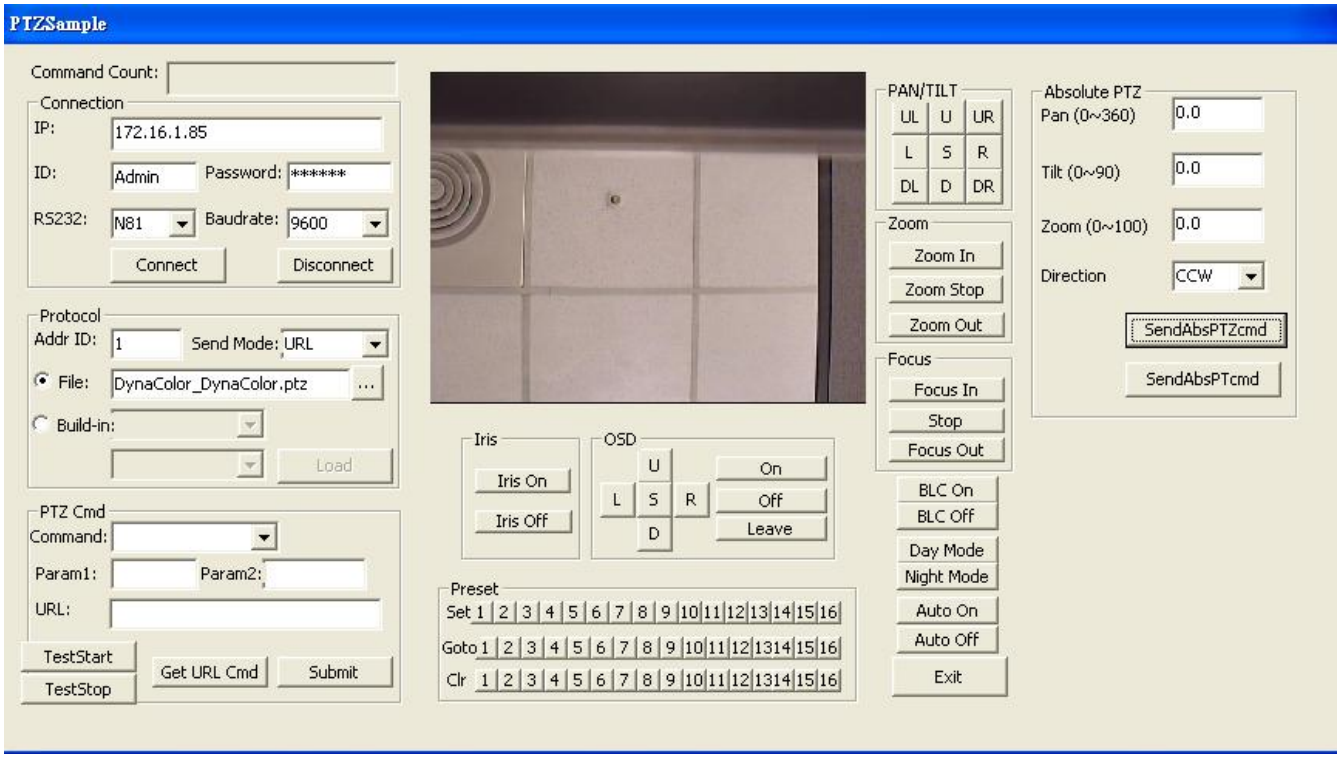
NOTE: Firmware does not contain PTZ protocol information. User's application has to prepare the PTZ command string and execute the string directly

The benefits of the PTZ Integration architecture are listed as follow:

- Utilize tested protocols
- Provides PTZ operation command strings
- Provides important commands like Day and Night switch, Patrol, Pattern, IR, etc
- Provides OSD operation

PTZ Parser Source Code

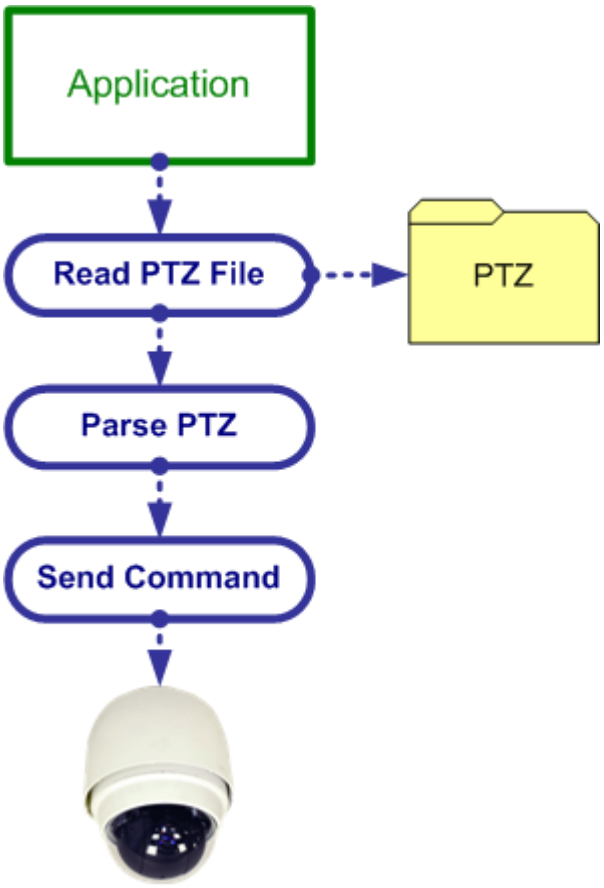
Please refer to **`${SDK-DIR}\SDK\PTZSample`** for sample source code. Also, ACTi provides integrated PTZ protocol files under **`${SDK-DIR}\PTZ-Protocol`**.



Steps to integrate a PTZ protocol include:

1. **Read PTZ File**: read PTZ protocol file specified
2. **Parse PTZ command**: parse the PTZ command rules, calculate the checksum and prepare the PTZ command
3. **Send Command**: sends PTZ command out with URL command or `netSend2ServerSerialPort()` function

(Most of new PTZ APIs in SDK 10000 V1.2 proceed step 1 and 2 at the same time)



PTZ Protocol Files ${SDK-DIR}\PTZ-Protocol

This section describes the definition of PTZ protocol files. Please get these files from **`${SDK-DIR}\PTZ-Protocol\`** directory. A sample fragment of the protocol file looks like follow

```
ADDRIDSTART; 1; 0;;;;
ADDRIDPOS; 2; 0;;;;
CHECKSUM; $B7=$B2+$B3+$B4+$B5+$B6;;;
INTERVAL;0;0;;;;
PANTILT;-5;-5;0xFF,0x01,0x00,0x14,0x3F,0x3F,0x93;;;
OSDON;0;0;0xFF,0x01,0x00,0x03,0x00,0x5F,0x63;;;
OSDUP;0;0;0xFF,0x01,0x00,0x08,0x00,0x0C,0x15;;;
OSDENTER;0;0;0xFF,0x01,0x02,0x00,0x00,0x00,0x03;;;
```

The protocol file contains following commands:

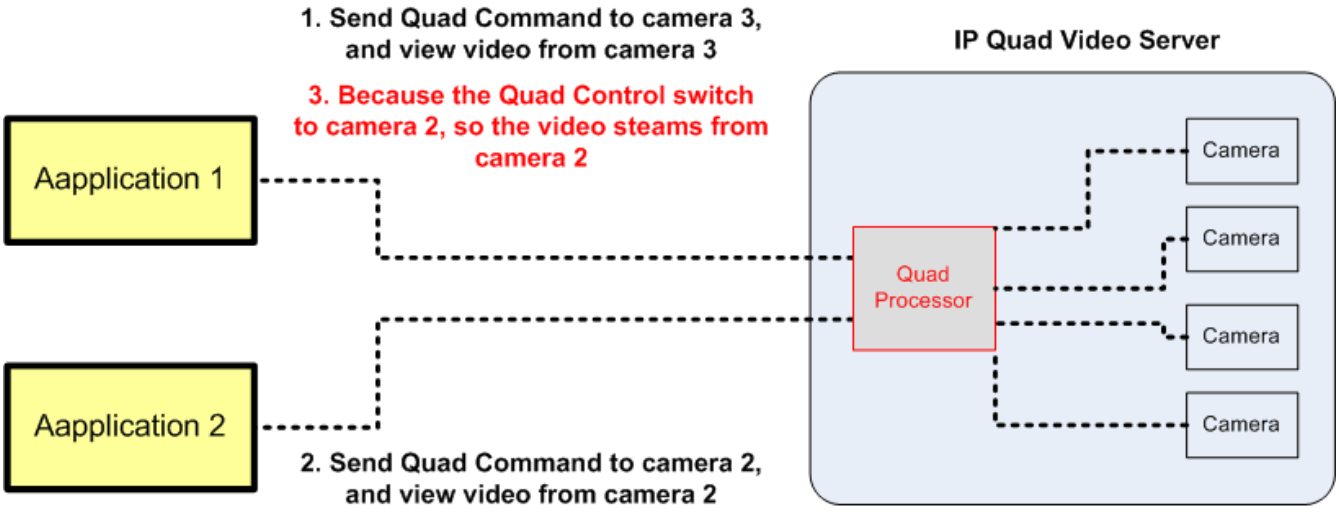
1. **`ADDRIDSTART`**: indicates the starting number of the address ID. Take above sample as an example (`ADDRIDSTART; 1; 0;;;;`), if the application is set to address ID as 3, then it starts at 1, so the calculated address ID is 3 (`0x03`);
2. **`ADDRIDPOS`**: indicates the position to replace with calculated address ID. Take above sample as an example (`ADDRIDPOS; 2; 0;;;;`), the address ID is at 2nd position of the command string. So, `PANTILT; -5, -5` command (`PANTILT;-5;-5;0xFF,0x01,0x00,0x14,0x3F,0x3F,0x93;;;`) will be replace as (`PANTILT;-5;-5;0xFF,0x03,0x00,0x14,0x3F,0x3F,0x93;;;`)
3. **`CHECKSUM`**: indicates the checksum rule, **`+`** is to run **`AND`** operation, **`|`** is to run **`OR`** operation, **`^`** is to run **`XOR`** operation. Take above sample as an example (`CHECKSUM; $B7=$B2+$B3+$B4+$B5+$B6;;;`), the checksum rule is to run **`AND`** operation for byte 2, byte 3, byte 4, byte 5 and byte 6, and the result is placed at byte 7. Then this becomes a final `PTZ command string`
4. Application then sends the calculated `PTZ command string` out via normal serial port operation or URL command.

6 IP Quad Video Server Integration

IP Quad Architecture

IP Quad is a Quad processor which connects to 4 analog video sources then multiplexed by a quad processor; in this way, an IP Quad video server may generates 1 Full D1 video stream or 4 CIF video streams at the same time

IP Quad video server firmware contains URL commands, so that application may simply sends out the URL command to control the behavior of it.



NOTE: There is only one quad processor in the device, so when an application sends a URL command to the IP Quad video server, then the quad processor will execute the commands specified, and all connected application will receive the same result from quad processor.

IP Quad URL Commands

Application may just use URL Command to perform these tasks to setup and control Quad Video Server; for information that needs to retrieve from Quad Video Server (e.g. Retrieve video stream, record to files, motion detection event, digital input event), the calling methods are all the same as SDK-2000 v1.0.

IP Quad's quad control is based on URL Command, which means that you need to send out the URL Command to IP Quad to set certain parameters.

HTTP Code Status

HTTP Code	HTTP Text	Description
200	OK	The request has succeeded, but an application error can still occur, which will be returned as an application error code.
204	No Content	The server has fulfilled the request, but there is no new information to send back.
400	Bad Request	The request had bad syntax or was inherently impossible to be satisfied.
401	Unauthorized	The request requires user authentication or the authorization has been refused.
404	Not Found	The server has not found anything matching the request.
409	Conflict	The request could not be completed due to a conflict with the current state of the resource.
500	Internal Error	The server encountered an unexpected condition which prevented it from fulfilling the request.
503	Service Unavailable	The server is unable to handle the request due to temporary overload.

```
Example :
Return success http context
HTTP/1.0 200 OK\r\n
Content-Type: text/plain\n
 \n

Return failed http context
HTTP/1.0 200 OK\r\n
Content-Type: text/plain\n
 \n
ERROR: error description
```

How to set display mode

Syntax	http://192.168.1.1/cgi-bin/quad?DISPLAY=n

How to get display mode

Syntax	http://192.168.1.1/cgi-bin/quad?DISPLAY

<parameter>	<values>	Description
DISPAY	n: 0~4	0: quad display 1: display channel 1 2: display channel 2 3: display channel 3 4: display channel 4

How to set OSD enabled

Syntax	http://192.168.1.1/cgi-bin/quad?OSD_ENABLED=0xnn

How to get OSD enabled status

Syntax	http://192.168.1.1/cgi-bin/quad?OSD_ENABLED

7 Advanced Topics

Callback Functions

This section lists the callback functions and its explanation for references.

Category	Function	Description
Decode	`KSetImageCallback()`	Callback functions to receive RGB buffer.
Event	`KSetDICallback()`	DI event triggers
Event	`KSetMotionDetectionCallback()`	Motion detection event triggers
MPEG-4	`KSetRawDataCallback()`	Streaming raw data including Video and Audio. All data are in TCP v2.0 format.
MPEG-4	`KSetTimeCodeCallback()`	Timecode is sent to this callback function every time a frame arrives
Preview	`KSetAfterRenderCallback()`	Callback functions are called every time a frame is drawn on the screen. This is useful when user wants to draw their own OSD, Text or video intelligence information overlay on the preview window
Preview	`KSetResolutionChangeCallback()`	Callback function is called when resolution is changed.
RS-232	`KSetRS232DataCallback()`	RS-232/RS-422/RS-485 data arrives
System	`KSetVideoLossCallback()`	Video loss event triggers.
System	`KSetVideoRecoveryCallback()`	Video recovery event triggers.
System	`KSetNetworkLossCallback()`	Network loss is sent if disconnect.

Deals with RAW file format

This section describes the ways to deal with ".raw" data format, which is a standard of ACTi products.

including:

- Raw file header
- Raw file footer
- Data payload. (Video and Audio)

Deal Raw File Header and Footer

Here is the sample of catching raw header and footer. The detail is described in marked section.

```
/**  \brief Header of Raw file.
*
*/
typedef struct
{
      DWORD           dwFirstB2;          // '00' '00' '01' 'B2'
      DWORD           dwStreamType;       // 11 : TCP-1.0; 22 TCP-2.0
      DWORD           dwVideoType;        // 11 : ISO 14496; 22 : ...
      DWORD           dwAudioType;        // 00 : NONE; 11 : PCM; ...
      DWORD           dwControlType;      // 00 : NONE; 11 : TCP-2.0
      DWORD           dwAudio2Type;       // Reserve
      DWORD           dwControl2Type;     // Reserve
      DWORD           dwBiteRate;               // Bite rate 0 - 15
      DWORD                 dwFps;                    // FPS for the file
      DWORD                 dwResolution;       // Resolution :0 - 5
      DWORD                 dwReserve1;               // Reserve from 1 - 6 :FF
      DWORD                 dwReserve2;               // Reserve from 1 - 6 :FF
      DWORD                 dwReserve3;               // Reserve from 1 - 6 :FF
      DWORD                 dwReserve4;               // Reserve from 1 - 6 :FF
      DWORD                 dwReserve5;               // Reserve from 1 - 6 :FF
      DWORD                 dwReserve6;               // Reserve from 1 - 6 :FF

}RawFileHeader_t;
/**  \brief Tail of Raw file.
*
*/
typedef struct
{
      DWORD           dwLastB2;           /**< '00' '00' '01' 'B2' */
      DWORD           dwHeader;           /**< Must be 0xAC710517 (ACTi0517) */
      DWORD           dwVersion;          /**< Must be 0x01000001 (1.0.0.1) */
      DWORD           dwBeginTime;
      DWORD           dwEndTime;
      DWORD           dwGOP;
```

```
    DWORD           dwGOPSize;
    DWORD           dwFPS;
    DWORD           dwWidth;
    DWORD           dwHeight;
    DWORD           dwFrameCount;
    DWORD           dwReserve;          /**< Time Zone */     // New define in 20060829
    DWORD           dwChecksumMethod;
    DWORD           dwChecksum;                 /**< Checksum value of header */
}RawFileTail_t;
```

Get the Header and Footer

```
    // File open for read.
    if((m_fp = fopen(m_MediaConfig.PlayFileName, "rb")) == NULL)
    {
        return false;
    }

    // Set file size
    SetFileSize();

    // Read File header
    if(!ReadData(&m_RawFileHeader, sizeof(RawFileHeader_t)))
    {
        return false;
    }

    // Read File Tail
    fseek(m_fp, m_dwFileSize - sizeof(RawFileTail_t), SEEK_SET);

    if(!ReadData(&m_RawFileTail, sizeof(RawFileTail_t)))
    {
        return false;
    }

    // Set file position to first data, the first I frame.
    fseek(m_fp, sizeof(RawFileHeader_t), SEEK_SET);
```

Raw File Payload

The raw data format (video and audio) is described as follow:

Video Data: **I-Frame Data Structure** , **P-Frame Data Structure**, **Motion JPEG frame**, **H.264 frame**

Audio Data: **Audio frame**

Deals with Media Stream

This section describes the ways to deal with media stream, including:

- The raw data callback (Video and Audio)
- How to detects I-Frame
- Decode I-Frame only

Raw Data Format in TCP 2.0

Please refer your request to our Sales representative for detailed protocol and MPEG-4 data format specification.

MPEG-4 stream raw data format (video and audio) is described as follow:

Video Data: **I-Frame Data Structure** , **P-Frame Data Structure** , **Motion JPEG frame, H.264 frame**

Audio Data: **Audio frame**

Get Streaming Raw Data (Video + Audio)

Steps to get streaming raw data include:

1. Register to the IP devices
2. Setup kmpeg4 callback function

```
//---- prepare callback function when MPEG-4 raw data arrives

//5 types are needed
// 1. mpeg4
// 2. Audio PCM (not always with time stamp)
// 3. Audio PCM must with time stamp
// 4. MJPEG
// 5. H.264
enum Raw_Data_Type
{
     EXCEPTION = 0,
     MPEG4_DATA = 1,
     AUDIO_PCM_DATA = 2,
     AUDIO_PCM_TIMESTAMP_DATA = 3,
     MJPEG_DATA = 4,
     H264_DATA = 5
};
void RawDataCallBack(DWORD id, DWORD dwDataType, BYTE* buf, DWORD len )
{
    switch (dwDataType)
    {
       Case MPEG4_DATA:
//do something for video stream
       break;

       Case AUDIO_PCM_DATA:
//do something for audio stream
       break:

       Case AUDIO_PCM_TIMESTAMP_DATA:
//do something for audio stream
       break:

       Case MJPEG_DATA:
//do something for Motion JPEG stream
       break:

       Case H264_DATA:
```

```
//do something for H264 stream
       break:
     }
}
// Prepare yourself callback function first

//---- register server
     HANDLE hK =  KOpenInterface();
// you should get HANDLE by KOpenInterface before Preview

// Set call back functions
     KSetRawDataCallback(hK, id, RawDataCallBack);

// Prepare USER_INFO data structure by filling IP address, account, password.
     MEDIA_CONNECTION_CONFIG mcc;
// Set your connection information into struct mcc.
     mcc.ContactType = CONTACT_TYPE_UNICAST_PREVIEW;
     strcpy(mcc.UserID, “Your ID”);
     strcpy(mcc.Password, “Your Password”);
     mcc.RegisterPort = 6000;
     mcc.ControlPort = 6001;
     mcc.StreamingPort = 6002;
     mcc.MultiCastPort = 5000;
     mcc.HTTPPort = 80;
     strcpy(mcc.UniCastIP, “172.16.1.81”);
     strcpy(mcc.MultiCastIP, “225.5.6.81);

// Set media configuration file.
     KSetMediaConfig(hK, &mcc);
// Register
     KConnect(hK);
// Start Streaming
     KStartStreaming(hK);
// Start receiving data from KMpeg4
     KPlay(hK);

//---- below list some step if you need terminate whole process
     KStop(hK);
     KStopStreaming(hK);
     KDisconnect(hK);
     KCloseInterface(hK);
```

Detect I-Frame (key frame)

Steps to detect I-Frame in MPEG-4 raw data include:

1. Process in MPEG-4 raw data callback function
2. Check the MPEG-4 raw data format

Video data structure:

I Frame = **User Data** + **Bitstream Data** + **I-Frame Data**

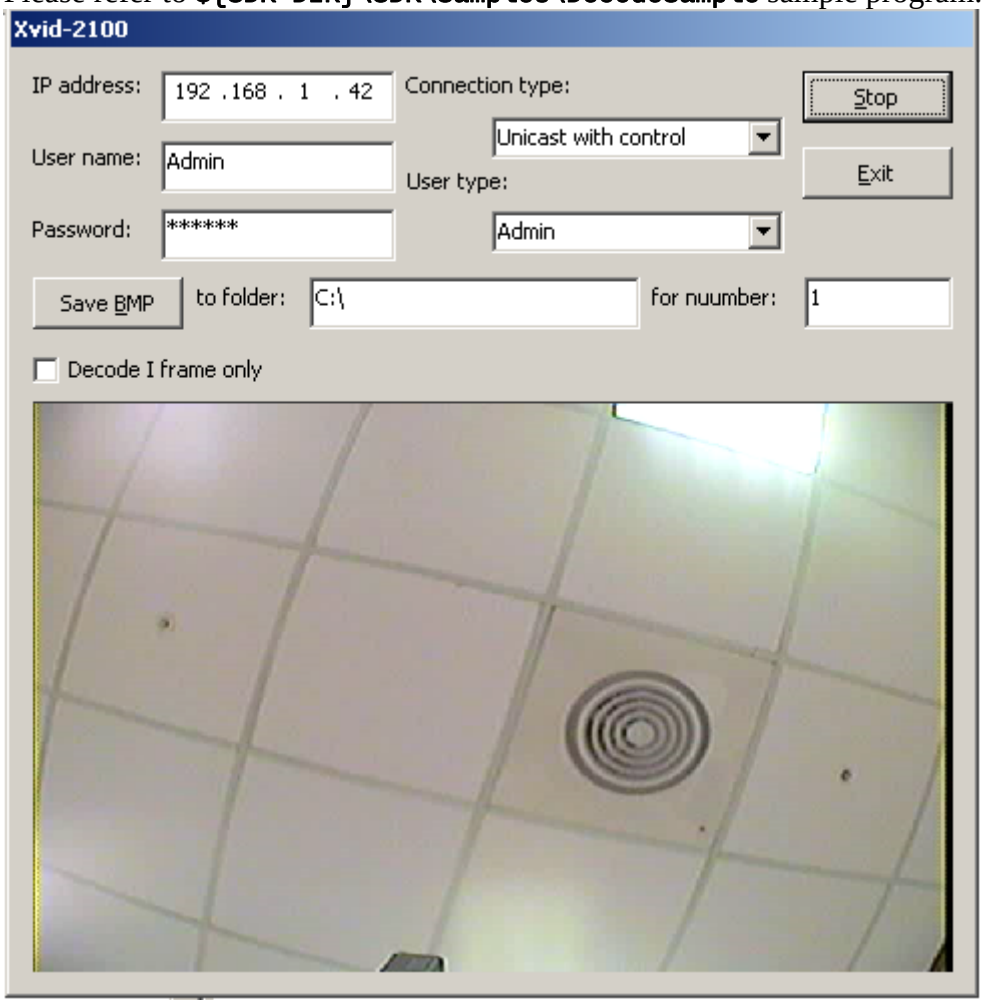
```
// in C++ language example, here shows to know an I-Frame
// We suppose BYTE* buf is a continuous raw data for one frame
// compare 0xB3010000 with 4 bytes from the 75th byte in BYTE* buf
     DWORD f;
     CopyMemory( (BYTE*)&f, (buf+75), sizeof( DWORD ) );

     // an I-Frame
     if( f == 0xB3010000 )
     {
     }
     else ; //---- P-Frame
```

Decode MPEG-4 Stream with Xvid

ACTi MPEG-4 stream complies with standard ISO-14496-2 format and can be decoded with open source MPEG-4 software decoders, including FFMPEG, Xvid, DivX, etc.

Please refer to **`${SDK-DIR}\SDK\Samples\DecodeSample`** sample program.



Steps to use netSetMpeg4RawDataCallBack and decode by XVID:

1. Link libxvidcore.lib as Import Lib
2. Put xvidcore.dll in the same directory
3. Include xvid.h
4. Provide following initialize, create, decode, close xvid code.

```
#include "xvid.h"

DWORD m_vWidth;
char  pOutBuf[720*576*3];
```

```
xvid_dec_create_t   m_xvidDecHandle;
xvid_gbl_init_t     xvid_gbl_init;
int                 xvidret;

//------------------------------------------------------------------------
// XVID Decord Init and Create ==>

        memset(&xvid_gbl_init, 0, sizeof(xvid_gbl_init));
        memset(&m_xvidDecHandle, 0, sizeof(m_xvidDecHandle));
        m_xvidDecHandle.version = XVID_VERSION;
        m_xvidDecHandle.height = 0;
        m_xvidDecHandle.width = 0;
        xvid_gbl_init.version = XVID_VERSION;
        xvidret = xvid_global(0, XVID_GBL_INIT, &xvid_gbl_init, 0);
        xvidret = xvid_decore(NULL, XVID_DEC_CREATE, &m_xvidDecHandle, NULL);

//------------------------------------------------------------------------
// XVID Decord ==>  Put the code into the netSetMpeg4RawCallBack 's CallBack Function

        xvidDecFrame.output.csp = XVID_CSP_BGR;
        xvidDecFrame.general = XVID_LOWDELAY|XVID_DEBLOCKY|XVID_DEBLOCKUV;
        xvidDecFrame.general = XVID_LOWDELAY;
        xvidDecFrame.version = XVID_VERSION;
        xvidDecFrame.output.plane[0] = pOutBuf;              // <<<<<<<

//------------------------------------------------------------------------
// Output Buffer for the Decord out put

        // <<<<<<< The Video's Width Size => m_vWidth * 3, (a Pixel is 3 Bytes (RGB))
        // <<<<<<< The m_vWidth can get from the Mpeg4 Raw Data
        // <<<<<<< (In the input buffer that first time the callback be called)
        // <<<<<<< Or can assign by yourself if you know what is the video's width
        xvidDecFrame.output.stride[0] = m_vWidth * 3;

        xvidDecFrame.bitstream = pInBuf;     // <<<<<<< The Mpeg4 Raw Data
        xvidDecFrame.length = Len;           // <<<<<<< Mpeg4 Raw Data's Length

        xvidret    =    xvid_decore(m_xvidDecHandle.handle,    XVID_DEC_DECODE,
&xvidDecFrame, 0);
        // Todo : pOutBuf -> Display

//------------------------------------------------------------------------
// XVID Decord Close ==>

xvidret = xvid_decore(m_xvidDecHandle.handle, XVID_DEC_DESTROY, 0, 0);
```

Get RGB Image Data

Get RGB Image Data with Image Callback Function

Steps to get RGB image data with image callback function:

1. Register to the IP devices
2. Initialize stream
3. Start stream
4. Setup image callback function

```
//---- prepare image callback function

Void ImageCallBack(DWORD id, BYTE* pBuf, DWORD len, long w, long h)
{
// list sample below for save BMP file to “save.bmp” after get RGB data
     LPBITMAPINFO lpbih = (LPBITMAPINFO)pBuf ;
     Long lImageLen=(lpbih->bmiHeader).biSize \ (lpbih->bmiHeader).biSizeImage ;

     BITMAPFILEHEADER oHeader ;
     oHeader.bfType = 0x4d42 ;
     oHeader.bfReserved1 = 0;
     oHeader.bfReserved2 = 0;
     oHeader.bfSize      =      (DWORD)(sizeof(BITMAPFILEHEADER)      \      +
(lpbih->bmiHeader).biSize + (lpbih->bmiHeader).biSizeImage) ;
    oHeader.bfOffBits        =        (DWORD)(sizeof(BITMAPFILEHEADER)        +
(lpbih->bmiHeader).biSize) ;

    CFile oImage ;
    oImage.Open(“save.bmp”, CFile::modeCreate | CFile::modeWrite ) ;
    oImage.Write( &oHeader, sizeof(BITMAPFILEHEADER) );
    oImage.Write( pBuf, (lpbih->bmiHeader).biSize ) ;

    for(int i = lpbih->bmiHeader.biHeight-1 ; i >= 0 ; i--)
        oImage.Write(            (pBuf+(lpbih->bmiHeader).biSize            +
(i*lpbih->bmiHeader.biWidth*4)), lpbih->bmiHeader.biWidth*4) ;

    oImage.Close();
}

    HANDLE hK =  KOpenInterface();
```

```
// you should get HANDLE by KOpenInterface before Preview

// Set call back functions
    KSetRawDataCallback(hK, id, RawDataCallBack);

// Set Display Informationm
    MEDIA_RENDER_INFO mri;
    mri.RenderInterface = DGDI;
    mri.hWnd = m_hWnd;             // Windows' handle to draw
    mri.rec = m_rec;               // rec information.
    KSetRenderInfo(hK, &mri);

// Prepare USER_INFO data structure by filling IP address, account, password.
    MEDIA_CONNECTION_CONFIG mcc;
// Set your connection information into struct mcc.
    mcc.ContactType = CONTACT_TYPE_UNICAST_PREVIEW;
    strcpy(mcc.UserID, "Your ID");
    strcpy(mcc.Password, "Your Password");
    mcc.RegisterPort = 6000;
    mcc.ControlPort = 6001;
    mcc.StreamingPort = 6002;
    mcc.MultiCastPort = 5000;
    mcc.HTTPPort = 80;
    strcpy(mcc.UniCastIP, "172.16.1.81");
    strcpy(mcc.MultiCastIP, "225.5.6.81);

// Set media configuration file.
    KSetMediaConfig(hK, &mcc);
// Register
    KConnect(hK);
// Start Streaming
    KStartStreaming(hK);
// Start receiving data from KMpeg4
    KPlay(hK);

// Plug Image callback for get RGB Image
    KSetImageCallback(hK, dwCallBackID, ImageCallBack);
.. .. ..
.. .. ..

// below list some step if you need terminate whole process
    Stop(hK);
    KStopStreaming(hK);
    KDisconnect(hK);
    KCloseInterface(hK);
```

Save RGB Data into a BMP file

We can get raw data and save to other file format e.g. if we want to save the current frame to Bitmap file for website image index. Just as like as general computer file format the Bitmap file has itself format. The Bitmap file format has a **BITMAPFILEHEADER**, **BITMAPINFORHEAR** and bitmap bits. Luckily we just have to prepare the header because the bitmap bits that we can get from MPEG-4 Callback function. Below is the 24 bit Bitmap file example.

Steps to save RGB data into a BMP file include:

1. Register to the IP devices
2. Initialize stream
3. Start stream
4. Setup image callback function
5. Create **BITMAPFILEHEADER** data structure and write to file

NOTE: Please refer to **/SDK/Samples/DecodeSample** sample program for full source codes.

F

First we have to create the **BITMAPFILEHEADER** struct and write to file.

```
// Save 24bit BMP
long BufferSize = 720*480*3;
// Write out the file header
//
BITMAPFILEHEADER bfh;
memset( &bfh, 0, sizeof( bfh ) );
bfh.bfType = 'MB';
bfh.bfSize = sizeof( bfh ) + BufferSize + sizeof( BITMAPINFOHEADER );
bfh.bfOffBits = sizeof( BITMAPINFOHEADER ) + sizeof( BITMAPFILEHEADER );

DWORD Written = 0;
WriteFile( hf, &bfh, sizeof( bfh ), &Written, NULL );
```

Second we have to create the **BITMAPINFOHEADER** struct and write to file.

```
// Write the bitmap format
//
BITMAPINFOHEADER bih;
memset( &bih, 0, sizeof( bih ) );
bih.biSize = sizeof( bih );
bih.biWidth = 720;
bih.biHeight = -480;  //Save from down to up
bih.biPlanes = 1;
bih.biBitCount = 24;
Written = 0;
WriteFile( hf, &bih, sizeof( bih ), &Written, NULL );
```

Finally we only need to write the bitmap bits to file and close it.

```
// Write the bitmap bits
//
Written = 0;
WriteFile( hf, xvidDecFrame.output.plane[0], BufferSize, &Written, NULL );

// Close BMP file
CloseHandle( hf );
```

Save Recording to an AVI file

Steps to save recording data into an AVI file include:

1. Register to the IP devices
2. Sets MPEG-4 raw data callback
3. Sets FourCC type as "**vids**"
4. Sets FourCC handle as "**DX50**"
5. Calls AVI functions when receiving frames

NOTE: Please refer to **MSDN** sample or Microsoft web site for reference.

```
A
VIFileInit(); // initializes the AVIFile library

strcpy((char*)g_aviname, m_NormalSaveFile);  // file name
g_aviframesize = (m_width * m_height * 3) / 2;

   // Is the file exist?
FILE *fp = fopen(m_NormalSaveFile, "rb");  if (fp)  {
   fclose(fp);
   DeleteFile(m_NormalSaveFile); // delete it.
}

AVISTREAMINFO g_strhdr_out;
BITMAPINFO g_header;
  // clear the struct
memset(&g_strhdr_out, 0, sizeof(g_strhdr_out));

g_strhdr_out.fccType              = mmioFOURCC('v', 'i', 'd', 's');// stream type
g_strhdr_out.fccHandler           = mmioFOURCC('D', 'X', '5', '0');
g_strhdr_out.dwScale              = 1001;
g_strhdr_out.dwRate               = (DWORD)(m_theFps * 1001);
g_strhdr_out.dwSuggestedBufferSize  = g_aviframesize;

g_header.biSize = 40;
g_header.biWidth = m_width;
g_header.biHeight = m_height;
g_header.biPlanes = 1;
g_header.biBitCount = 0;
g_header.biCompression = g_strhdr_out.fccHandler;
g_header.biSizeImage = g_aviframesize * 2;
```

```
g_header.biXPelsPerMeter = 0;
g_header.biYPelsPerMeter = 0;
g_header.biClrUsed =0;
g_header.biClrImportant =0;

   // Create a AVI file.
hr = AVIFileOpen(&m_pAviFile, (char*)g_aviname, OF_WRITE | OF_CREATE, NULL);
if (hr != AVIERR_OK) {
   AVIFileExit();
   return -1;
}

// Create a interface to the new stream.
hr = AVIFileCreateStream(m_pAviFile, &m_pAviVideo, &g_strhdr_out);
if (hr != AVIERR_OK) {
   AVIFileExit();
   return -1;
}
   // sets the format of a stream at the specified position
hr = AVIStreamSetFormat(m_pAviVideo, 0, &g_header, sizeof(g_header));
if (hr != AVIERR_OK) {
   AVIFileExit();
   return -1;
}

m_AviFrameNo = 0;

if (IFrame)
   m_AviFlag = AVIIF_KEYFRAME; // I frame
else
   m_AviFlag = 0;

// write data to stream
hr = AVIStreamWrite(m_pAviVideo, m_AviFrameNo++, 1,
   (LPBYTE) (m_PreSaveFrame[j]),
   m_PreSaveFrameLen[j], m_AviFlag,
   NULL, NULL);

if (hr != AVIERR_OK) {
   return -1; // Record AVIStreamWrite Error6
}

   // Release the Stream
AVIStreamRelease(m_pAviVideo);
```

```
   // Release the file
AVIFileRelease(m_pAviFile);

   // Release the AVIFile Libary
AVIFileExit();
```

Save Recording to an AVI file with SDK Function

Steps to save recording data into a AVI file include:

1. Connect to the IP devices
2. Sets File Writer Type to AVI
3. Start record

```
// Create a interface to the new stream.
HANDLE h = KopenInterface();
KSetMediaConfig( h , cfg );
...
KConnect( h );
KStartStreaming( h );
...

KSetFileWriterType( h, FAVI /* 1 */ );  // To record by AVI mode
                                        // FAVI is a defined macro
KStartRecord( h, “FileName.avi”);
```

Register Control Connection Only

Register to control connection only if you only want to receive events from video server but not video data (for example: motion, DI). You can also send commands through control connection(for example: PTZ command, set motion…etc).

Steps to register with control connection only:

1. Call **`KOpenInterface()`** to get KMpeg4 handle.
2. Prepare IP address, port number, account, password, contact type..
3. Call **`KSetMediaConfig(HANDLE, MEDIA_CONNECTION_CONFIG)`** to set connect config.
4. Set Contact type to **`CONTACT_TYPE_CONTROL_ONLY`**.
5. Call **`KConnect(HANDLE).`**
6. Call **`KStartStreaming(HANDLE)`** to get ready to receive.
7. Call **`KPlay(HANDLE)`** to start receive.

```
// you should get HANDLE by KOpenInterface before Preview
    HANDLE hK = KOpenInterface();

// Set call back functions
    KSetRawDataCallback(hK, id, fnRawCallback);

// Prepare USER_INFO data structure by filling IP address, account, password.
    MEDIA_CONNECTION_CONFIG mcc;
// Set your connection information into struct mcc.
    mcc.ContactType = CONTACT_TYPE_CONTROL_ONLY;
    …
    KSetMediaConfig(hK, &mcc);
    KConnect(hK);

// Start Streaming
    KStartStreaming(hK);

// Start Receive
    KPlay(hk);
```

Display text on screen

Steps to display text on screen while previewing.

1. Call **`KOpenInterface()`** to get KMpeg4 handle.
2. Prepare IP address, port number, account, password, contact type..
3. Call **`KSetMediaConfig(HANDLE, MEDIA_CONNECTION_CONFIG)`** to set connect config.
4. Set Contact type .
5. Call **`KConnect(HANDLE).`**
6. Call **`KStartStreaming(HANDLE)`** to get ready to receive.
7. Call **`KPlay(HANDLE)`** to start receive.
8. Call **`KSetTextOut()`** to diaply text.

```
// you should get HANDLE by KOpenInterface before Preview
    HANDLE hK = KOpenInterface();

// Set call back functions
    KSetRawDataCallback(hK, id, fnRawCallback);

// Prepare USER_INFO data structure by filling IP address, account, password.
    MEDIA_CONNECTION_CONFIG mcc;
// Set your connection information into struct mcc.
    mcc.ContactType = CONTACT_TYPE_UNICAST_PREVIEW;
    …
    KSetMediaConfig(hK, &mcc);
// Set render info
    MEDIA_RENDER_INFO mri;
    KSetRenderInfo(h, &mri);

    KConnect(hK);

// Start Streaming
    KStartStreaming(hK);

// Start Receive
    KPlay(hk);

// Display text
    KSetTextOut(h, 0, 0, 0, “123456789\0”, 9, true, false, false, “Arial”, 100,
    RGB(255, 255, 0), 2, RGB(0, 0, 255);
```

Use IPP codec

Steps to use IPP codec while previewing.

1. Call **`KOpenInterface()`** to get KMpeg4 handle.
2. Prepare IP address, port number, account, password, contact type..
3. Select codec by **`KSetCODECType(HANDLE h, int nType, int nChannel);`**
4. Call **`KSetMediaConfig(HANDLE, MEDIA_CONNECTION_CONFIG)`** to set connect config.
5. Set Contact type .
6. Call **`KConnect(HANDLE).`**
7. Call **`KStartStreaming(HANDLE)`** to get ready to receive.
8. Call **`KPlay(HANDLE)`** to start receive.

```
// you should get HANDLE by KOpenInterface before Preview
    HANDLE hK = KOpenInterface();

// Select codec
    KSetCODECType(h, IPPCODEC, 0);
// Set call back functions
    KSetRawDataCallback(hK, id, fnRawCallback);

// Prepare USER_INFO data structure by filling IP address, account, password.
    MEDIA_CONNECTION_CONFIG mcc;
// Set your connection information into struct mcc.
    mcc.ContactType = CONTACT_TYPE_UNICAST_PREVIEW;
    …
    KSetMediaConfig(hK, &mcc);

// Set render info
    MEDIA_RENDER_INFO mri;
    KSetRenderInfo(h, &mri);

    KConnect(hK);

// Start Streaming
    KStartStreaming(hK);

// Start Receive
    KPlay(hk);
```

8 ACTi MPEG-4 Data Structure

Connection Type

Unicast Video and Control Connection

The section describes the mechanism on how to search ACTi's IP surveillance products on network. With this mechanism, you can locate the devices on the network, then use URL commands to operate or manage those devices.

The function sends out a broadcast message, ACTi's devices respond with detailed information, application then parse the replied information and parse the content with **NET_SEARCHSERVER** data structure.

Multicast Video + Control connection

The section describes the mechanism on how to search ACTi's IP surveillance products on network. With this mechanism, you can locate the devices on the network, then use URL commands to operate or manage those devices.

Multicast Video(Without Connection)

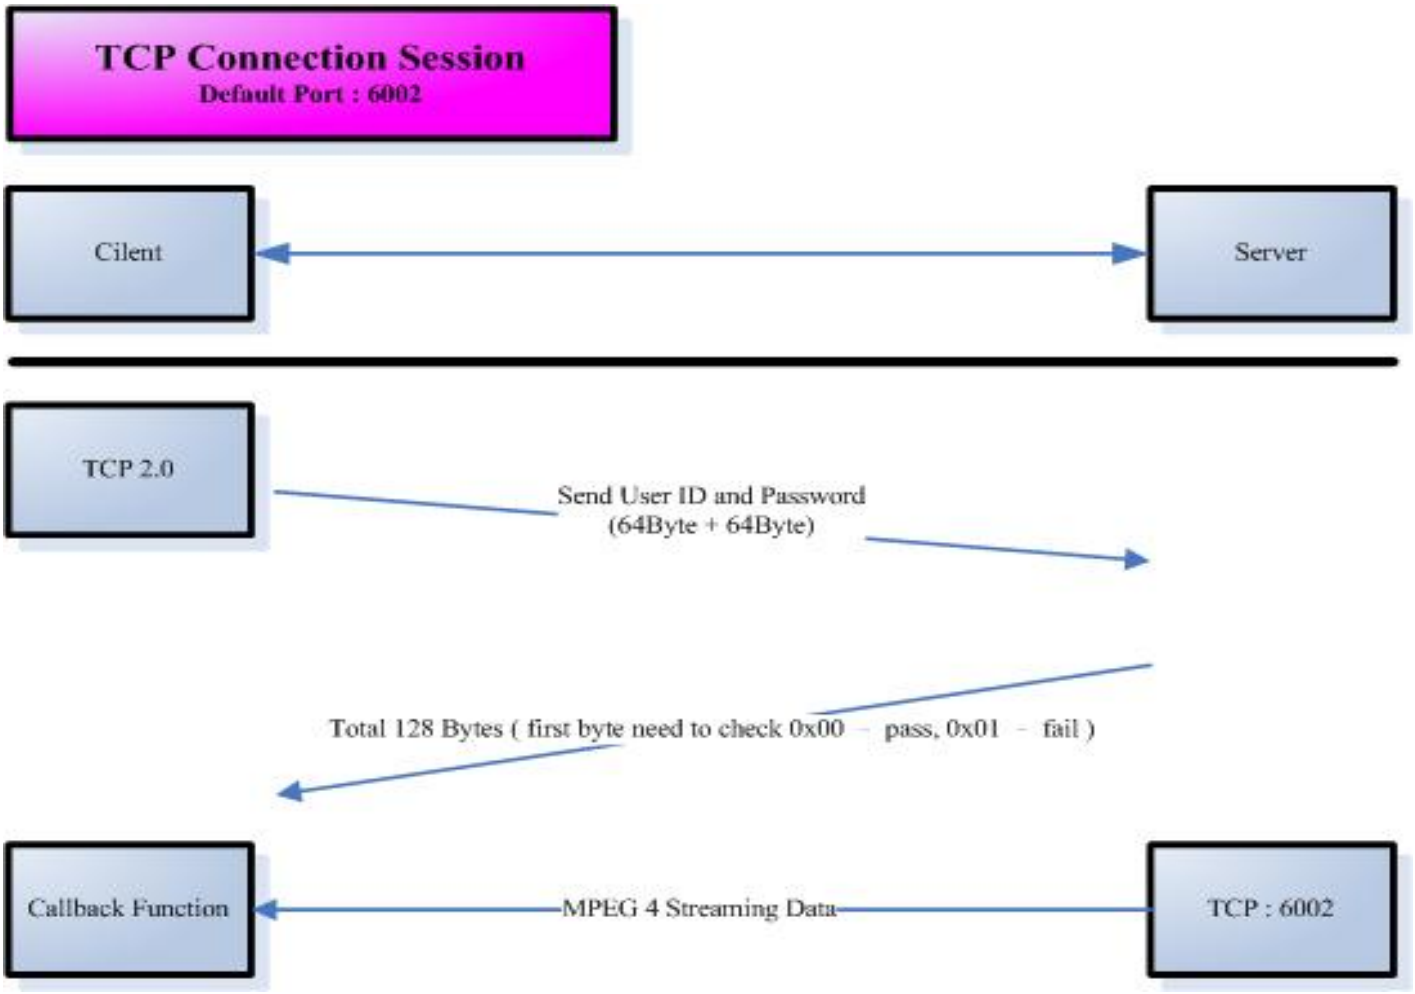
The section describes the mechanism on how to search ACTi's IP surveillance products on network. With this mechanism, you can locate the devices on the network, then use URL commands to operate or manage those devices.

Unicast Video and Control

Connect to Video Server

Here lists steps to build up the connection of getting audio/video streaming data.

1. Create a TCP socket connection that is needed to specific the IP and port. The default port is 6002.
2. Send a 128bytes command to video server. That includes User ID 64 bytes and Password 64 bytes.
3. Then we will get the response code. It are total 128 bytes code and includes a byte connect result.
4. Receive the data that will be audio/video streaming data.



Definition of B2 Frame

The B2 Frame is composed of B2 Header and B2 Payload. The length of B2 Header is fixed to 12 bytes. The length of B2 payload is variable length depends on the B2 MsgType defined in the B2 Header.

There is two kind of B2 Frame for video and audio usage.

Video B2 Frame (44 Byte):

```
typedef struct {
    B2_HEADER    header;
    PRIVATE_DATA  prdata;
} VIDEO_B2_FRAME;
```

Audio B2 Frame (28 Byte):

```
typedef struct {
    B2_HEADER header;
    struct timeval timestamp;
    unsigned char reserved[8];
} AUDIO_B2;
```

These structures will be detailed in rest of this chapter.

Mpeg4 Video Data Format

Video and Audio Frame

After the connection is established, this section introduces how to get the streaming data from video Server.

We use the private data header(0x000001B2) to be the header tag. When we receive the data tag is the 0x000001B2 and the follow is the struct B2_HEADER. If the msg_type of the B2_HEADER is 1 and this frame is the video frame. Another 2 is the audio frame.

Video frame

Mpeg4 streaming data has two kind of video frame that is called I-Frame and P-Frame. There have some different. The I-Frame includes the sequence header that describe the information of decode(Bitstream data) like as below.

Header(0x000001B2) VIDEO_B2_FRAME	Bitstream Data (0x000001B0)	I-Frame data

The P-Frame is simple than I-Frame. It doesn't include the sequence header.

Header(0x000001B2) VIDEO_B2_FRAME	P-Frame data

I-Frame Data Structure

B2 Header for Video

```
typedef struct {
    B2_HEADER    header;
    PRIVATE_DATA  prdata;
} VIDEO_B2_FRAME;

#define HEAD_MSG_B2_VIDEO_MPEG4              0x01
#define HEAD_MSG_B2_AUDIO_8KPCM              0x02
#define HEAD_MSG_B2_AUDIO_TIMESTAMP_8KPCM   0x03
#define HEAD_MSG_B2_VIDEO_MJPEG              0x04
#define HEAD_MSG_B2_VIDEO_H264               0x05

typedef struct {
    unsigned char b2h[4];  /* 00 00 01 B2 */
    unsigned char msg_type;
    unsigned char stream_id; /* video streaming id */
    unsigned char ext_b2_len; /* 1: length of the ext. b2 private data appended
                                 to B2 frame */
    unsigned char rsvd;
    unsigned int  len;
} B2_HEADER

typedef struct {
    DWORD         date_time;   //(time_t)
    unsigned char  time_zone;  /* 0:-12, ..., 24:+13 */
    unsigned char  video_loss;  /* 0: video loss, 1 : video ok */
    unsigned char  motion;     /* 0x02: Motion 1 is active, 0x04: Motion 2 is
                                  active, 0x08 Motion 3 is active */
    unsigned char  dio;        /* for DIs, 0: DI triggered. 1: no triggered */
    unsigned int   count;      /* frame counter */
    unsigned char  resolution;  /* 0:N720x480, ... */
    unsigned char  bitrate;    /* 0:28K, ... */
    unsigned char  fps_mode;  /* 0:MODE1(constant), 1:0:MODE2 */
    unsigned char  fps_number; /* In constant FPS mode, it indicates the video
                                  server's constant FPS number.
                                  In variable FPS mode, in indicates the variable
                                  FPS number which was requested by the TCP
                                  host. If it is not in TCP, it indicates the
                                  variable FPS number */
```

```
    struct timeval timestamp;
    unsigned short md_actives[3];   /* # of active microblocks in motion region
                                       */
    unsigned char reserved[2];
} PRIVATE_DATA_B2;
```

Name	Size
B2_HEADER	12 bytes (0x000001B2)
PRIVATE_DATA_B2	32 bytes

The user data segment total bytes : 44 bytes.

Bitstream Data

Name	Size
B0 Header	4 bytes (0x000001B0)
B0 Data	1 byte
B5 Header	4 bytes (0x000001B5)
B5 Data	1 byte
Sequence header	4 bytes (0x00000100)
Sequence data	17 bytes
	31 bytes

The Bitstream data segment total bytes : 31 bytes (B0 Header + B0 Data + B5 Header + B5 data + Sequence header + Sequence data).

I-Frame Data

Name	Size
B3 Header	4 bytes (0x000001B3)
B3 Data	3 bytes
B6 Header	4 bytes (0x000001B6)
Frame data	N bytes
	11 + N bytes

The I-Frame data segment total bytes : 11 bytes + N bytes(B3 Header + B3 Data + B6 Header + I-Frame data).

P-Frame Data Structure

B2 Header for Video

```
typedef struct {
    B2_HEADER    header;
    PRIVATE_DATA_B2   prdata;
} VIDEO_B2_FRAME;

#define HEAD_MSG_B2_VIDEO_MPEG4              0x01
#define HEAD_MSG_B2_AUDIO_8KPCM              0x02
#define HEAD_MSG_B2_AUDIO_TIMESTAMP_8KPCM   0x03
#define HEAD_MSG_B2_VIDEO_MJPEG              0x04
#define HEAD_MSG_B2_VIDEO_H264               0x05
typedef struct {
    unsigned char b2h[4];  /* 00 00 01 B2 */
    unsigned char msg_type;
    unsigned char stream_id; /* video streaming id */
    unsigned char ext_b2_len; /* 1: length of the ext. b2 private data appended
                                 to B2 frame */
    unsigned char rsvd;
    unsigned int  len;
} B2_HEADER

typedef struct {
    time_t       date_time;
    unsigned char  time_zone;  /* 0:-12, ..., 24:+13 */
    unsigned char  video_loss;  /* 0: video loss, 1 : video ok */
    unsigned char  motion;     /* 0x02: Motion 1 is active, 0x04: Motion 2 is
                                  active, 0x08 Motion 3 is active */
    unsigned char  dio;        /* for DIs, 0: DI triggered. 1: no triggered */
    unsigned int   count;      /* frame counter */
    unsigned char  resolution;  /* 0:N720x480, ... */
    unsigned char  bitrate;    /* 0:28K, ... */
    unsigned char  fps_mode;  /* 0:MODE1(constant), 1:0:MODE2 */
    unsigned char  fps_number; /* In constant FPS mode, it indicates the video
                                  server's constant FPS number.
                                  In variable FPS mode, in indicates the variable
                                  FPS number which was requested by the TCP
                                  host. If it is not in TCP, it indicates the
                                  variable FPS number */
    struct timeval timestamp;
    unsigned short md_actives[3];   /* # of active microblocks in motion region
```

```
                                    */
    unsigned char reserved[2];
} PRIVATE_DATA_B2;
```

Name	Size
B2_HEADER	12 bytes (0x000001B2)
PRIVATE_DATA_B2	32 bytes

The user data segment total bytes : 44 bytes.

P-Frame Data

Name	Size
B6 Header	4 bytes (0x000001B6)
Frame data	N bytes
	4 + N bytes

The P-Frame data segment total bytes : 4 bytes + N bytes(B6 Header data + P-Frame data).

Code Mapping in B2 Header

1.Time Zone

Time Zone	time_zone in PRIVATE_DATA_NEW
-12	0
-11	1
-10	2
-09	3
-08	4
-07	5
-06	6
-05	7
-04	8
-03	9
-02	10
-01	11
+00	12
+01	13
+02	14
+03	15
+04	16
+05	17
+06	18
+07	19
+08	20
+09	21
+10	22
+11	23
+12	24
+13	25
other time zone setting 1	26
another time zone setting 2	27
…	…

2.Resolution

Video Resolution	resolution in PRIVATE_DATA_NEW	
	Binary Value	Hex Value
NTSC		
N160x120	01000111b	0x47
N320x240	01000110b	0x46
N1920x1080	01000101b	0x45
N1600x1200	01000100b	0x44
N1280x1024	01000011b	0x43
N1280x960	01000010b	0x42
N1280x720	01000001b	0x41
N720x480	00000000b	0x00
N640x480	01000000b	0x40
N352x240	00000001b	0x01
N160x112	00000010b	0x02
N176x120	00000110b	0x06
PAL		
P720x576	00000011b	0x03
P640x480	11000000b	0xC0
P352x288	00000100b	0x04
P176x144	00000101b	0x05

3.Bitrate

Video Bitrate	bitrate in PRIVATE_DATA_NEW
28K	0
56K	1
128K	2
256K	3
384K	4
500K	5
750K	6
1M	7
1.2M	8
1.5M	9
2M	10
2.5M	11
3M	12
3.5M	13
4M	14
4.5M	15
5M	16
5.5M	17
6M	18

Note: In MJPEG mode and Variable Bitrate mode, this bitrate setting in B2 is not valid. It will be fixed at the current encoder bitrate setting which is for constant bit rate mode with MPEG4 or H.264 encoding.

Audio frame

The data structure of audio frame is simpler than video frame. We can see as below.

AUDIO_B2(0x000001B2)	Audio Frame data (audio 8K pcm payload data)

```
#define HEAD_MSG_B2_VIDEO_MPEG4              0x01
#define HEAD_MSG_B2_AUDIO_8KPCM              0x02
#define HEAD_MSG_B2_AUDIO_TIMESTAMP_8KPCM    0x03
#define HEAD_MSG_B2_VIDEO_MJPEG              0x04
#define HEAD_MSG_B2_VIDEO_H264               0x05
typedef struct {
    unsigned char b2h[4];  /* 00 00 01 B2 */
    unsigned char msg_type;
    unsigned char stream_id; /* video streaming id */
    unsigned char ext_b2_len; /* 1: length of the ext. b2 private data appended
                                 to B2 frame */
    unsigned char rsvd;
    unsigned int  len;
} B2_HEADER
```

```
typedef struct {
    B2_HEADER header;
    struct timeval timestamp;
    unsigned char reserved[8];
} AUDIO_B2;
```

Name	Size
AUDIO_B2	28bytes (0x000001B2)
Audio Frame Data	N bytes
	28 + N bytes

The audio total bytes : AUDIO_B2 + FrameData (28 bytes + N)

Notice: The old version firmware send B2_HEADER(12 bytes) instead AUDIO_B2 (28 bytes)

Control Connect Session

Besides the video session we can get some of control from the control connection session.

Send a 128bytes command to the IP device.

Build a connection

When we connect to a video server by control session, we follow steps below to connect with video server.

1. Create a TCP socket connection that is needed to specific the IP and port. The default port is 6001.
2. Send a 128bytes command to video server. That includes User ID 32 bytes ,Token command and reserved bytes.
3. Then we will get the response code. It are total 128 bytes code and includes connect result, error code and reserve bytes
4. Receive the data that will be control data.

TCP Authentication Request and Response Frame

```
TCP Authentication Request and Response Frame
/* ##### definitions in msg_type in B2_HEADER ##### */
#define HEAD_MSG_VARIABLE_FPS_REQ  0x20
#define HEAD_MSG_PAUSE_ON_REQ     0x21
#define HEAD_MSG_PAUSE_OFF_REQ 0x22

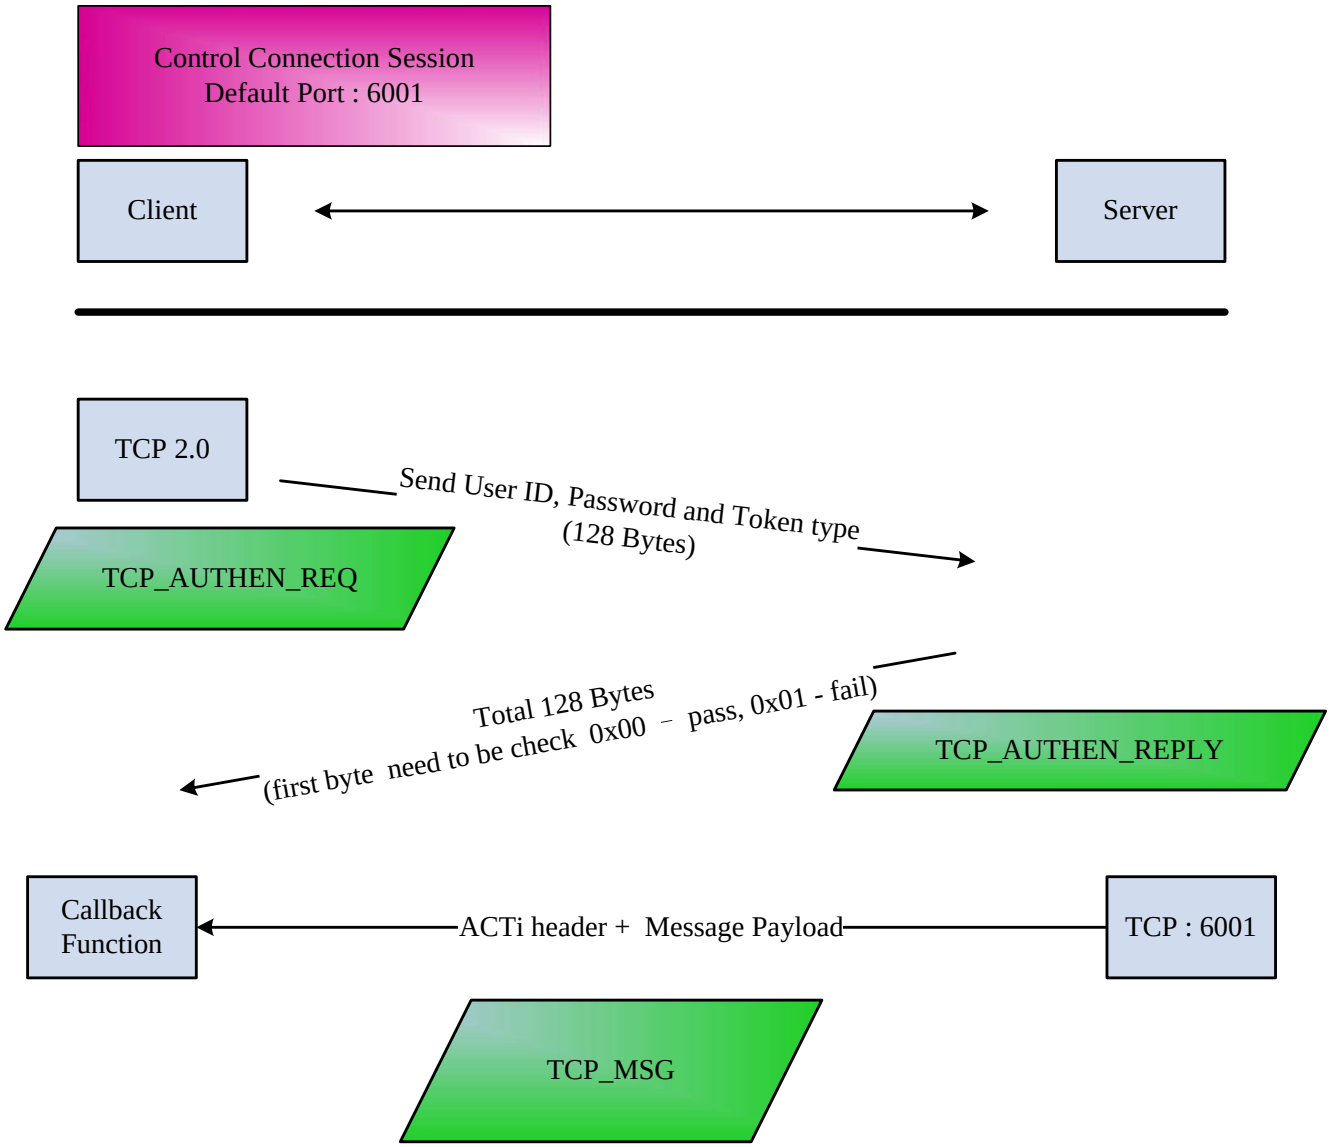
/* ##### definitions in server_reply in B2_HEADER ##### */
#define HEAD_HOST_REQUEST  0
#define HEAD_SERVER_REPLY  1

typedef struct {
    unsigned char b2h[4];  /* A C T i */
unsigned short msg_type; /* not used. reset to 0 */
unsigned char server_reply; /* not used, reset to 0 */
unsigned char stream_id; /* same definition as B2_HEADER */
    unsigned int  len;
} B2_HEADER;

/* ##### definitions in encryption_type in TCP_AUTHEN_REQ #### */
#define NAME_ENCODED_NONE      0
#define NAME_ENCODED_BASE64        1
typedef struct {
    char user_name[32];
    char rsvd[28];
    unsigned short stream_id;   /* same definition as B2_HEADER */
    unsigned short encryption_type;
    int  user_pwd[64];
} TCP_AUTHEN_REQ;
```

```
typedef struct {
     char status;
     char rsvd1;
     unsigned short stream_id;   /* same definition as B2_HEADER */
     int  sock;
     char camera_name[32];
     char rsvd2[88];
} TCP_AUTHEN_REPLY;

typedef struct {
     B2_HEADER header;
     unsigned char     msg[1];      /* variable length */
} TCP_MSG;
In msg_type = HEAD_MSG_VARIABLE_FPS_REQ, the msg[0] in TCP_MSG is the variable FPS
number
In msg_type = HEAD_MSG_PAUSE_ON_REQ or HEAD_MSG_PAUSE_OFF_REQ, there is no msg[].
In the reply packet, the msg[0] is the return code. The definition of the return
code is listed below.
#define TCP_REPLY_CODE_OK      0x00
#define TCP_REPLY_CODE_ERR 0x01
```



Control Connection Session
Default Port : 6001
Client
Server
TCP 2.0
Send User ID, Password and Token type
(128 Bytes)
TCP_AUTHEN_REQ
Total 128 Bytes
(first byte need to be check 0x00 – pass, 0x01 - fail)
TCP_AUTHEN_REPLY
Callback Function
ACTi header + Message Payload
TCP : 6001
TCP_MSG

Control Authentication Request and Response Frame

```
/* ##### definitions in msg_type in B2_HEADER */
/* LIVE CHECK used in the control session */
#define HEAD_MSG_LIVE      0x30
#define HEAD_MSG_EXIT      0x31
/* DIOs used in the control session */
#define HEAD_MSG_DIO_OUT   0x32
#define HEAD_MSG_DIO_STATUS  0x33
#define HEAD_MSG_DIO_INPUT    0x34  /* not used */
/* RS485 used in the control session */
#define HEAD_MSG_SERIAL_RECV  0x35  /* not used */
#define HEAD_MSG_SERIAL_SEND  0x36

#define ERR_ACCOUNT           0x00010001
#define ERR_UNKNOWN_TOKEN    0x00010002
#define ERR_CTRL_TOKEN_BUSY   0x00010003
#define ERR_AUDIO_TOKEN_BUSY  0x00010004
#define ERR_AUDIO_NOT_SUPPORT 0x00010005

typedef struct {
    char result;
    char reserved1;
    unsigned short stream_id; /* same definition as B2_HEADER */
    char reserved1[3];
    int  err_code;
    int  ip_addr;
    char reserved2[116];
} CTRL_RSP;
```

```
typedef struct {
    B2_HEADER header;
    unsigned char   msg[1];    /* variable length */
} CTRL_MSG_FRAME;
```

DOs coding in the msg[0] (1byte):

Bit[4] : DO2, Bit[3] : DO1, Bit[1]=DI2, Bit[0]:DI1, where 1: high level of DO, 0: low level of DO.

RS485 coding in msg[] (variable length):

Data string of the RS485/RS422/RS232 data

Camera name coding in msg[] (max 31 bytes) :

Encoder's VIDEO_CAMERA_NAME setting

Audio data in msg[] (fixed to 4096 bytes):

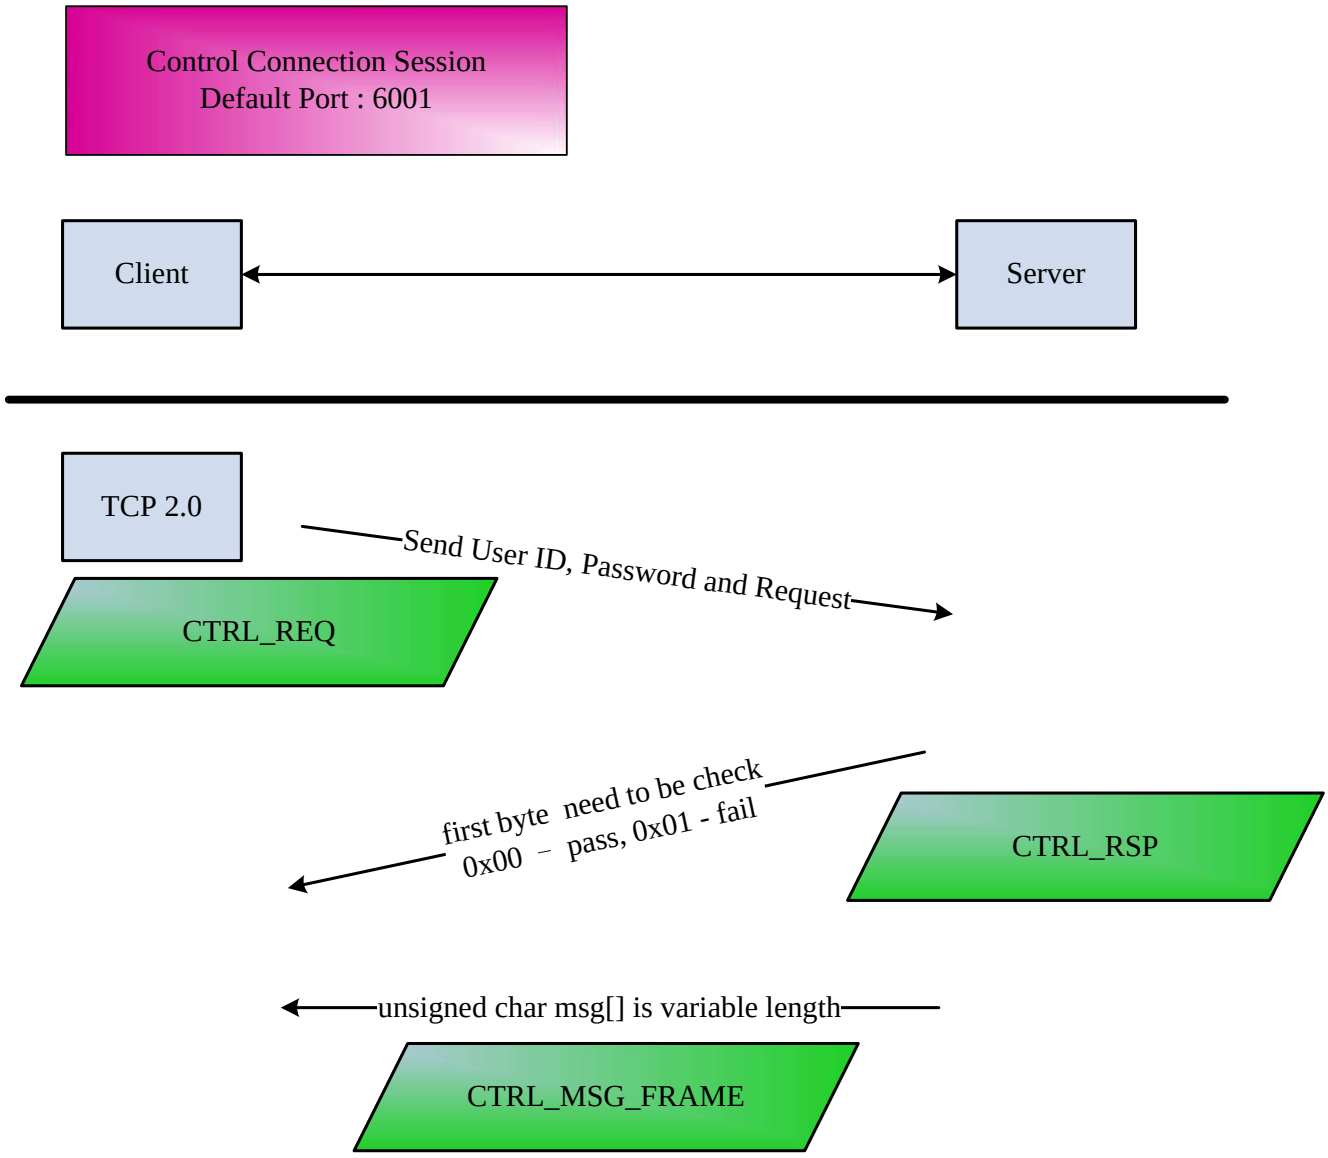
Audio data in host

Motion coding in the msg[0] (1byte):

Bit[1]: motion region 1, Bit[2]: motion region 2, Bit[3]: motion region 3, where 0: no motion, 1: detected motion

Video Loss coding in the msg[0] (1byte):

0: Video Loss, 1: Video Lock



Control Connection Session
Default Port : 6001
Client
Server
TCP 2.0
Send User ID, Password and Request
CTRL_REQ
first byte need to be check
0x00 – pass, 0x01 - fail
CTRL_RSP
unsigned char msg[] is variable length
CTRL_MSG_FRAME

9 ACTi JPEG-compressed Video Data Structure

JPEG-compressed Video Data Format

We won't repeat most topics which described well in chap.8 . This chapter will concentrate on Motion JPEG data structure.

Motion JPEG and Audio Frame

After the connection is established, this section introduces how to get the streaming data from video Server.

We use the private data header(0x000001B2) to be the header tag. When we receive the data tag is the 0x000001B2 and the follow is the struct B2_HEADER. If the msg_type of the B2_HEADER is 4 and this frame is the Motion JPEG frame. Others 2 and 3 are the audio frame.

Motion JPEG frame In TCP Session

MJPEG streaming data is formed by JPEGs. The JPEG-Frame of TCP concept is described below. The JPEG header and JPEG data composite a complete JPEG picture, which can be easily decode by JPEG support library. (If you are looking for more information about B2 header, please refer to chap 8. **B2**)

Header(0x000001B2) VIDEO_B2_FRAME	JPEG Header	JPEG data

Motion JPEG frame In RTP Session

The JPEG-Frame of RTP concept is described below. JPEG header is modified in RTP session, we will describe later. (If you are looking for more information about RTP Header, please refer to RFC 1889)

RTP Header	RTP/JPEG Header	JPEG QUANT Header	JPEG data	Header(0x000001B2) VIDEO_B2_FRAME

TCP/MJPEG Header

We section a part of description from "**JPEG File Interchange Format**" document to describe composition in TCP/JPEG header. The document can be acquired on **http://www.jpeg.org/** .

There are 5 parts in TCP/MJPEG header: SOI, Quant, SOF, DRI, and SOS.

Example of TCP/MJPEG Header

TCP MJPEG FRAME：

MJPEG ：

```

JPEG SOI：

FF	D8	FF	E0	JPEG SOI

length (2 bytes) Total APP0 field byte count, including the byte count value (2 bytes), but excluding the APP0 marker itself

identifier (5 bytes) = X'4A', X'46', X'49', X'46', X'00'
This zero terminated string ("JFIF") uniquely identifies this APP0 marker. This string shall have zero parity (bit 7=0).

version (2 bytes) = X'0102'
The most significant byte is used for major revisions, the least significant byte for minor revisions. Version 1.02 is the current released revision.

units (1 byte) Units for the X and Y densities.
units = 0: no units, X and Y specify the pixel aspect ratio
units = 1: X and Y are dots per inch
units = 2: X and Y are dots per cm

Xdensity (2 bytes) Horizontal pixel density
Ydensity (2 bytes) Vertical pixel density
Xthumbnail (1 byte) Thumbnail horizontal pixel count
Ythumbnail (1 byte) Thumbnail vertical pixel count
(RGB)n (3n bytes) Packed (24-bit) RGB values for the thumbnail pixels, n = Xthumbnail * Ythumbnail

RTP/MJPEG Header

We section a part of description from “rfc2435-RTP” document to describe composition in RTP/MJPEG header.

Main header

Type-specific	Fragment Offset (24 bits)

Type (8 bits)	Q (8 bits)	Width (8 bits)	Height (8 bits)

1. Type-specific: 8 bits
Interpretation depends on the value of the type field. If no interpretation is specified, this field MUST be zeroed on transmission and ignored on reception.

2. Fragment Offset: 24 bits
The Fragment Offset is the offset in bytes of the current packet in the JPEG frame data. This value is encoded in network byte order (most significant byte first). The Fragment Offset plus the length of the payload data in the packet MUST NOT exceed 2^24 bytes.

3. Type: 8 bits
The type field specifies the information that would otherwise be present in a JPEG abbreviated table-specification as well as the additional JFIF-style parameters not defined by JPEG. Types 0-63 are reserved as fixed, well-known mappings to be defined by this document and future revisions of this document. Types 64-127 are the same as types 0-63, except that restart markers are present in the JPEG data and a Restart Marker header appears immediately following the main JPEG header. Types 128-255 are free to be dynamically defined by a session setup protocol.

4. Q: 8 bits
The Q field defines the quantization tables for this frame. Q values 0-127 indicate the quantization tables are computed using an algorithm determined by the Type field (see below). Q values 128-255 indicate that a Quantization Table header appears after the main JPEG header (and the Restart Marker header, if present) in the first packet of the frame (fragment offset 0). This header can be used to explicitly specify the quantization tables in-band.

5. Width: 8 bits
This field encodes the width of the image in 8-pixel multiples (e.g., a width of 40 denotes an image 320 pixels wide). The maximum width is 2040 pixels.

6. Height: 8 bits
This field encodes the height of the image in 8-pixel multiples (e.g., a height of 30 denotes an image 240 pixels tall). When encoding interlaced video, this is the height of a video field, since fields are individually JPEG encoded. The maximum height is 2040 pixels.

Restart Marker header

This header MUST be present immediately after the main JPEG header when using types 64-127.

Restart Interval(16 bits)	F (1 bit)	L (1 bit)	Restart Count (14 bits)

Quantization Table header

This header MUST be present after the main JPEG header (and after the Restart Marker header, if present) when using Q values 128-255. It provides a way to specify the quantization tables associated with this Q value in-band.

MBZ(8 bits)	Precision (8 bit)	Length (16 bit)	Quantization Table Data (Length bits)

Example of RTP/MJPEG Header

RTP Header：

```
/*
* RTP data header from RFC1889
*/
typedef struct {
unsigned int version:2; /* protocol version */
unsigned int p:1; /* padding flag */
unsigned int x:1; /* header extension flag */
unsigned int cc:4; /* CSRC count */
unsigned int m:1; /* marker bit */
unsigned int pt:7; /* payload type */
u_int16 seq; /* sequence number */
u_int32 ts; /* timestamp */
u_int32 ssrc; /* synchronization source */
u_int32 csrc[1]; /* optional CSRC list */
} rtp_hdr_t;
```

RTP MJPEG FRAME：

```
00 00 00 00 41 FF 50 3C
00 0A FF FF
00 00 00 80
1A 18 16 16 18 31 23 25 1D 28 3A 33 3D 3C 39 33 38 37 40 48 5C 4E 40 44 57 45 37 38 50 6D 51 57

63 63 63 63 63 63 63 63 63 63 63 63 63 63 63 63 63 63 63 63 63 63 63 63 63 63 63 63 63 63 63 63
63 63 63 63 63 63 63 63 63 63 63 63 63 63 63 C9 B5 B7 6B 89 B9 CE D1 5B 91 A0 8D 00 50 29 D1
```

RTP JPEG HEADER：

```
00 00 00 00 41 FF 50 3C
```

```
// Annotations in this section describe how rtp/jpeg header be generated from normal JPEG
// header (TCP/MJPEG header).
//
struct jpeghdr
{
     unsigned int tspec:8;      // 0 not used
     unsigned int off:24;       // 0 not used
     unsigned char type;        // JPEG SOF [11]
                                // if SOF[11] == 0x21 Then type = 0;
                                // else Then type = 1;
                                // If jpeghdr_rst.dri Then type |= 0x40;
     unsigned char q;           // 0xff
     unsigned char width;       // JPEG SOF[5]; JPEG SOF[6];
                                // (SOF[5]<<8 | SOF[6]) >>3
     unsigned char height;      // JPEG SOF[7]; JPEG SOF[8];
                                // (SOF[7]<<8 | SOF[8]) >>3
};
```

RTP RESTART MARKER HEADER：

```
00 0A FF FF
struct jpeghdr_rst
{
     unsigned short dri;        // (JPEG DRI[4]<<8) | JPEG DRI[5]
     unsigned short f:1;        // always 1
     unsigned short l:1;        // always 1
     unsigned short count:14;   // always 0x3fff
};
```

RTP QUANTIZATION TABLE HEADER：

```
00 00 00 80
struct jpeghdr_qtable
{
     u_int8 mbz;          // not used
     u_int8 precision;    // JPEG SOF[4]
                          // if SOF[4] < 8 then precision = 0
                          // else then precision = (SOF[4]-8)/8
     u_int16 length;      // two bye after FF DB
};
```

RTP QUANTIZATION TABLE DATA：

The length of this table is “jpeghdr_qtable::length”; The table length of ACTi MJPEG is 64*2.

```

10 ACTi H.264 Video Data Structure

H.264-compressed Video Data Format

We won't repeat most topics which described well in chap.8 . This chapter will concentrate on H.264 data structure.

H.264 and Audio Frame

After the connection is established, this section introduces how to get the streaming data from video Server.

We use the private data header(0x000001B2) to be the header tag. When we receive the data tag is the 0x000001B2 and the follow is the struct B2_HEADER. If the msg_type of the B2_HEADER is 5 and this frame is the H.264 frame. Others 2 and 3 are the audio frame.

H.264 frame In TCP Session

The H264-Frame of TCP concept is described below. (If you are looking for more information about B2 header, please refer to chap 8. **B2**)

If the H.264 Frame is an I Frame, there will be a H.264 Sequence Header behind VIDEO_B2_FRAME.

Header(0x000001B2) VIDEO_B2_FRAME	H.264 Frame data

H.264 frame In C SDK 10000 connection

It's easy to connect a device which has H.264 ability, just like we mentioned in previous chapters. We can examine the streaming from device by raw data callback.

Steps to register to ACTi's device:

1. Prepare the callback function for raw data streaming.
2. Call **`KOpenInterface()`** to get KMpeg4 handle.
3. Set raw data callback by **`KSetRawDataCallback()`**
4. Prepare IP address, port number, account, password, contact type..

5. Call **KSetMediaConfig(HANDLE, MEDIA_CONNECTION_CONFIG)** to set connect config.
6. Call **KConnect(HANDLE).**
7. Call **KStartStreaming(HANDLE)** to get ready to receive.

```
//---- prepare callback function when MPEG-4 raw data arrives

//5 types are needed
// 1. mpeg4
// 2. Audio PCM (not always with time stamp)
// 3. Audio PCM must with time stamp
// 4. MJPEG
// 5. H.264
enum Raw_Data_Type
{
    EXCEPTION = 0,
    MPEG4_DATA = 1,
    AUDIO_PCM_DATA = 2,
    AUDIO_PCM_TIMESTAMP_DATA = 3,
    MJPEG_DATA = 4,
    H264_DATA = 5
};
void RawDataCallBack(DWORD id, DWORD dwDataType, BYTE* buf, DWORD len )
{
    switch (dwDataType)
    {
      Case MPEG4_DATA:
//do something for video stream
      break;

      Case AUDIO_PCM_DATA:
//do something for audio stream
      break:

      Case AUDIO_PCM_TIMESTAMP_DATA:
//do something for audio stream
      break:

      Case MJPEG_DATA:
//do something for Motion JPEG stream
      break:

      Case H264_DATA:
//do something for H264 stream
      break:
```

```
    }
}
// Prepare yourself callback function first

// you should get HANDLE by KOpenInterface before Preview
    HANDLE hK = KOpenInterface();

// Set call back functions
    KSetRawDataCallback(hK, id, fnRawCallback);

// Prepare USER_INFO data structure by filling IP address, account, password.
    MEDIA_CONNECTION_CONFIG mcc;
// Set your connection information into struct mcc.
    …
    KSetMediaConfig(hK, &mcc);
    KConnect(hK);

// Start Streaming
    KStartStreaming(hK);
```

H.264 frame In RTP Session

The H.264-Frame of RTP concept is different from JPEG/RTP concept. The NAL (Network Abstraction Layer) unit in header indicates the type of the pocket. (If you are looking for more information about H.264/RTP, please refer to RFC 3984)

NAL		
1 bits	2 bits	5 bits
F	NRI	TYPE

The NAL unit

The semantics of the components of the NAL unit type octet, as specified in the H.264 specification, are described briefly below.

F: 1 bit
forbidden_zero_bit. The H.264 specification declares a value of 1 as a syntax violation.

NRI: 2 bits
nal_ref_idc. A value of 00 indicates that the content of the NAL unit is not used to reconstruct reference pictures for inter picture prediction. Such NAL units can be discarded without risking the integrity of the reference pictures. Values greater than 00 indicate that the decoding of the NAL unit is required to maintain the integrity of the reference pictures.

Type: 5 bits
nal_unit_type. This component specifies the NAL unit payload type as defined bellow.

Type	Packet	Type name
1-23	NAL unit	Single NAL unit packet per H.264
24	STAP-A	Single-time aggregation packet
25	STAP-B	Single-time aggregation packet
26	MTAP16	Multi-time aggregation packet
27	MTAP24	Multi-time aggregation packet
28	FU-A	Fragmentation unit
29	FU-B	Fragmentation unit

Summary of NAL unit types and their payload structures

In current devices, we use 2 types of pocket. One is the “Sequence Header ”, and the other is ”FU-A”(Fragmentation Units).

Sequence Header Pocket (type 1-23) :

The sequence header pocket should be looked like this.

RTP Header (It's detailed in previous chapter.)	NAL (1 byte)	H.264 Sequence Header (unprocessed)	Header(0x000001B2) VIDEO_B2_FRAME

When the "NAL" is 0x67 (type of NAL is 1 to 23), the received pocket is "Sequence Header Pocket". We need further process to get complete "H.264 Sequence Header".
We have to extend NAL first, then append "unprocessed H.264 Sequence Header" later. The result will be "Complete H.264 Sequence Header".

Here is the concept code in C++.

```
if( h261_nal->TYPE >= 1 && h261_nal->TYPE <=23 )
{
 unsigned char header[5];
 unsigned char szCompleteH264SequenceHeader[2048];
      // NAL
      if( psz_buf[RTP_HEADER_LEN] == 0x67 )
      {
          header[0] = 0x00;
          header[1] = 0x00;
          header[2] = 0x00;
          header[3] = 0x01;
          header[4] = 0x67;

           memcopy(szCompleteH264SequenceHeader,header,5);
           memcopy(szCompleteH264SequenceHeader,
                   &psz_buf[RTP_HEADER_LEN+1],
                   POCKET_length - RTP_HEADER_LEN - 1 - B2_HEADER_LENGTH);

      }
}
```

FU-A(type 28) :

The FU header has the following format:

FU header			
1 bits	1 bits	1 bits	5 bits
S	E	R	TYPE

S: 1 bit
When set to one, the Start bit indicates the start of a fragmented NAL unit. When the following FU payload is not the start of a fragmented NAL unit payload, the Start bit is set to zero.

E: 1 bit
When set to one, the End bit indicates the end of a fragmented NAL unit, i.e., the last byte of the payload is also the last byte of the fragmented NAL unit. When the following FU payload is not the last fragment of a fragmented NAL unit, the End bit is set to zero.

R: 1 bit
The Reserved bit MUST be equal to 0 and MUST be ignored by the receiver.

Type: 5 bits
The NAL unit payload type.

The “FU-A pocket” should looked like this.

RTP Header (It’s detailed in previous chapter.)	NAL (1 byte)	FU header (1 byte)	FU Payload	
			(unprocessed segment of H.264 frame)	Header(0x000001B2) VIDEO_B2_FRAME (This B2 is attached when it’s the last segment of H.264 frame.)

When the type of NAL is 28, the received pocket is “FU-A Pocket”. We need further process to get complete “unprocessed segment of H.264 frame”.
We have to extend NAL and FU header first (bitwise operation), then append “unprocessed segment of H.264 frame “ later. The result will be “Complete segment of H.264 frame”.

Here is the concept code in C++.

```
unsigned char szCompleteH264Segment[SEGMENT_SIZE];

if( h261_nal->TYPE == 28 )
{
    //copy fu header
    fuheader = (FU_HAEDER *)&psz_buf[RTP_HEADER_LEN+1];
    …
    // if the S of fu header is 1 , the segment is the first segment in this H.264 frame
    if( fuheader->S == 1 )
    {
        //first byte of this segment is 0x88, so it’s a I frame
        if( (unsigned char)psz_buf[RTP_HEADER_LEN+2] == 0x88 )
        {
            // sometimes we put Sequence Header in front of I Frame for some decoder
            // I_Frame
            // Sequence + I Frame
            memcpy( frame.Buf+frame.Len, media.sequence_header, media.sequence_header_len);
            frame.Len += media.sequence_header_len;
        }
        else
        {

        }
        //
```

```
        header[0] = 0x00;
        header[1] = 0x00;
        header[2] = 0x00;
        header[3] = 0x01;
        header[4] = (h26l_nal->NRI & 0x03) << 5 | fuheader->TYPE & 0x2F;
        memcopy(szCompleteH264Segment,header,5);
        // nal and fu header = 2Bytes
        memcopy(szCompleteH264Segment,
               &psz_buf[RTP_HEADER_LEN+2],
               POCKET_length - RTP_HEADER_LEN - 2);

        …
}
memcpy( frame.Buf+frame.Len, szCompleteH264Segment, POCKET_length - RTP_HEADER_LEN - 2 );
frame.Len += (POCKET_length - RTP_HEADER_LEN - 2);

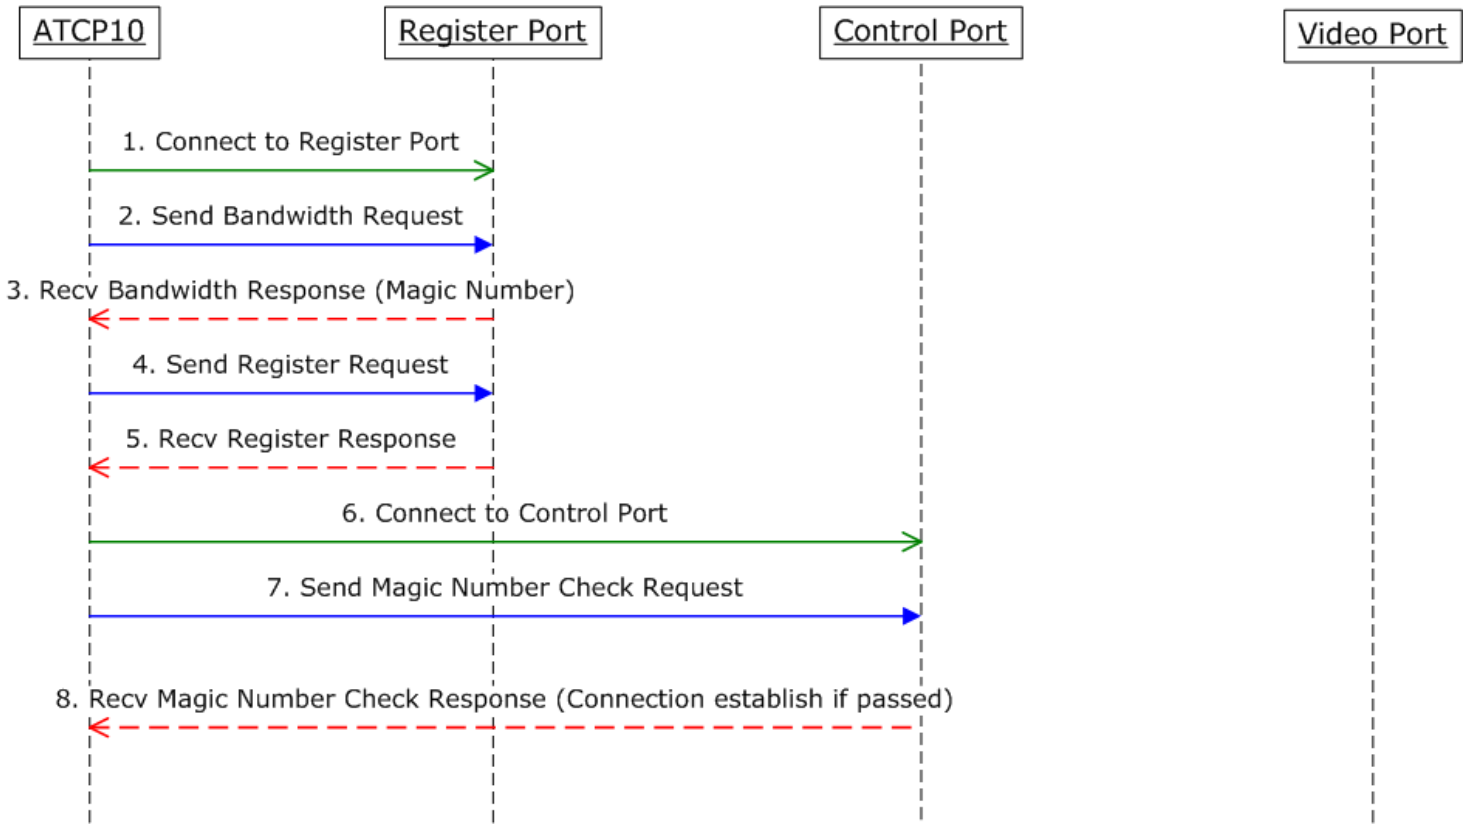
//When Marker in RTP header is 1 , this is the last segment in H.264 frame
if( rtp_header->Marker == 1 )
{
    // Check If there is a ACTI B2 Header 00 00 01 B2
    if( GetRTPVideoFrameType( &frame.Buf[frame.Len-B2_FRAME_LEN]) == RTP_FRAME_B2 )
    {
    }
    else
    {
    }

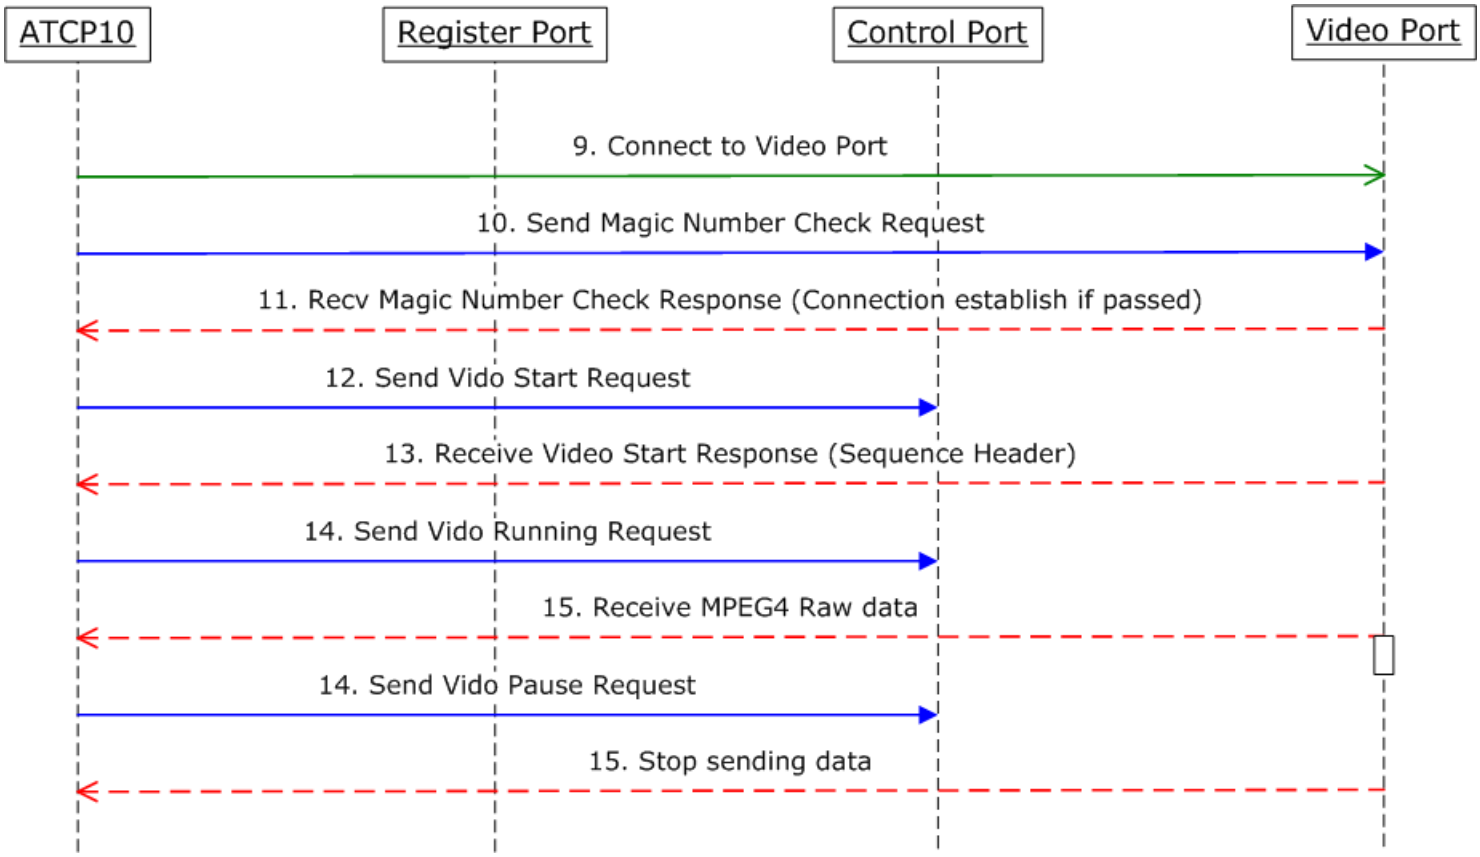
}
```

11 TCP and RTP/RTSP Packet Format

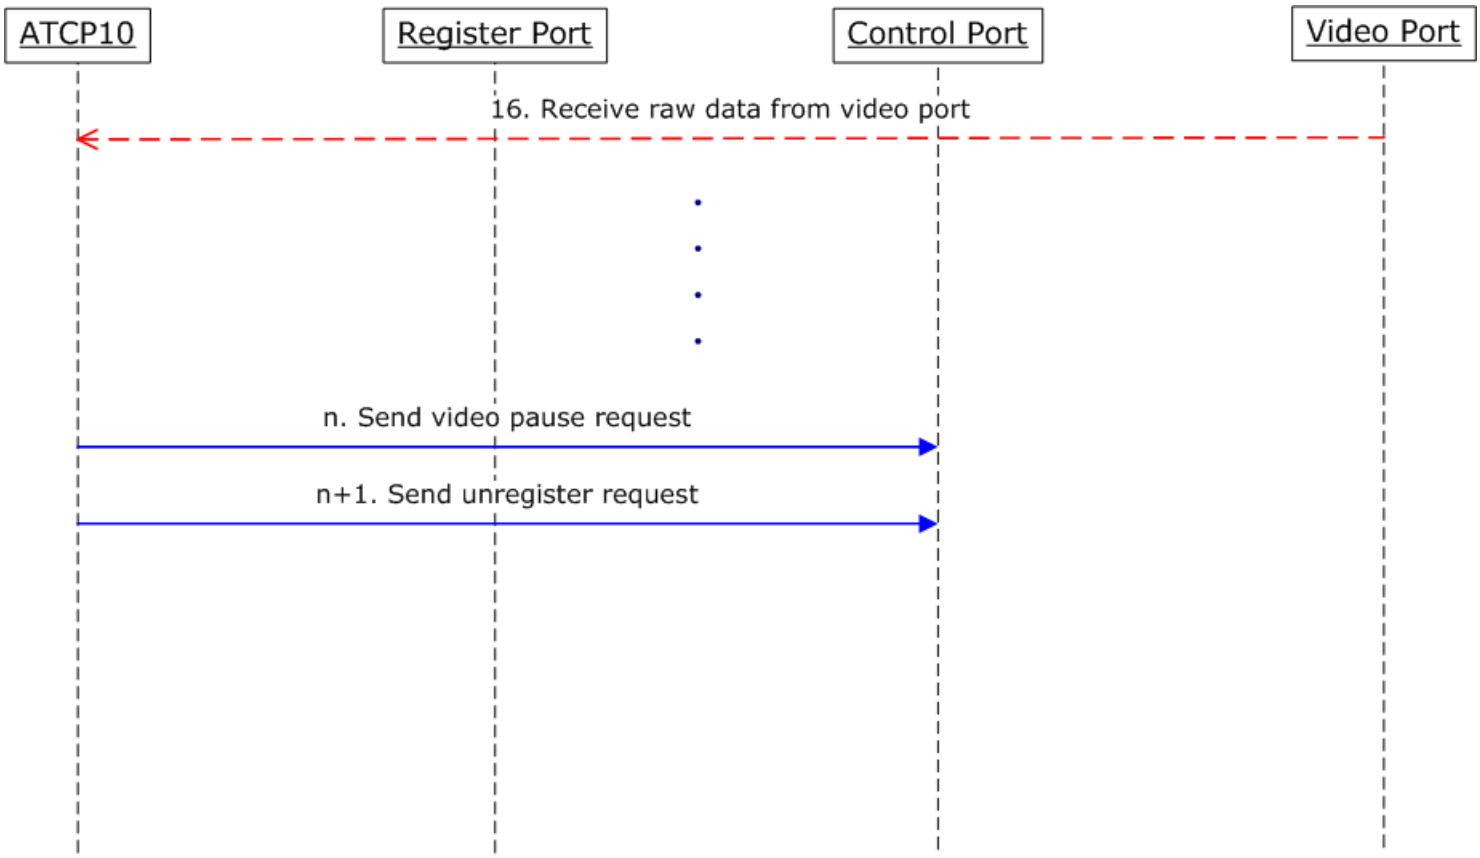
TCP v1.0 Packet

TCP v1.0 Video Connect Flow





ATCP10
Register Port
Control Port
Video Port
9. Connect to Video Port
10. Send Magic Number Check Request
11. Recv Magic Number Check Response (Connection establish if passed)
12. Send Vido Start Request
13. Receive Video Start Response (Sequence Header)
14. Send Vido Running Request
15. Receive MPEG4 Raw data
14. Send Vido Pause Request
15. Stop sending data



ATCP10
Register Port
Control Port
Video Port
16. Receive raw data from video port
n. Send video pause request
n+1. Send unregister request

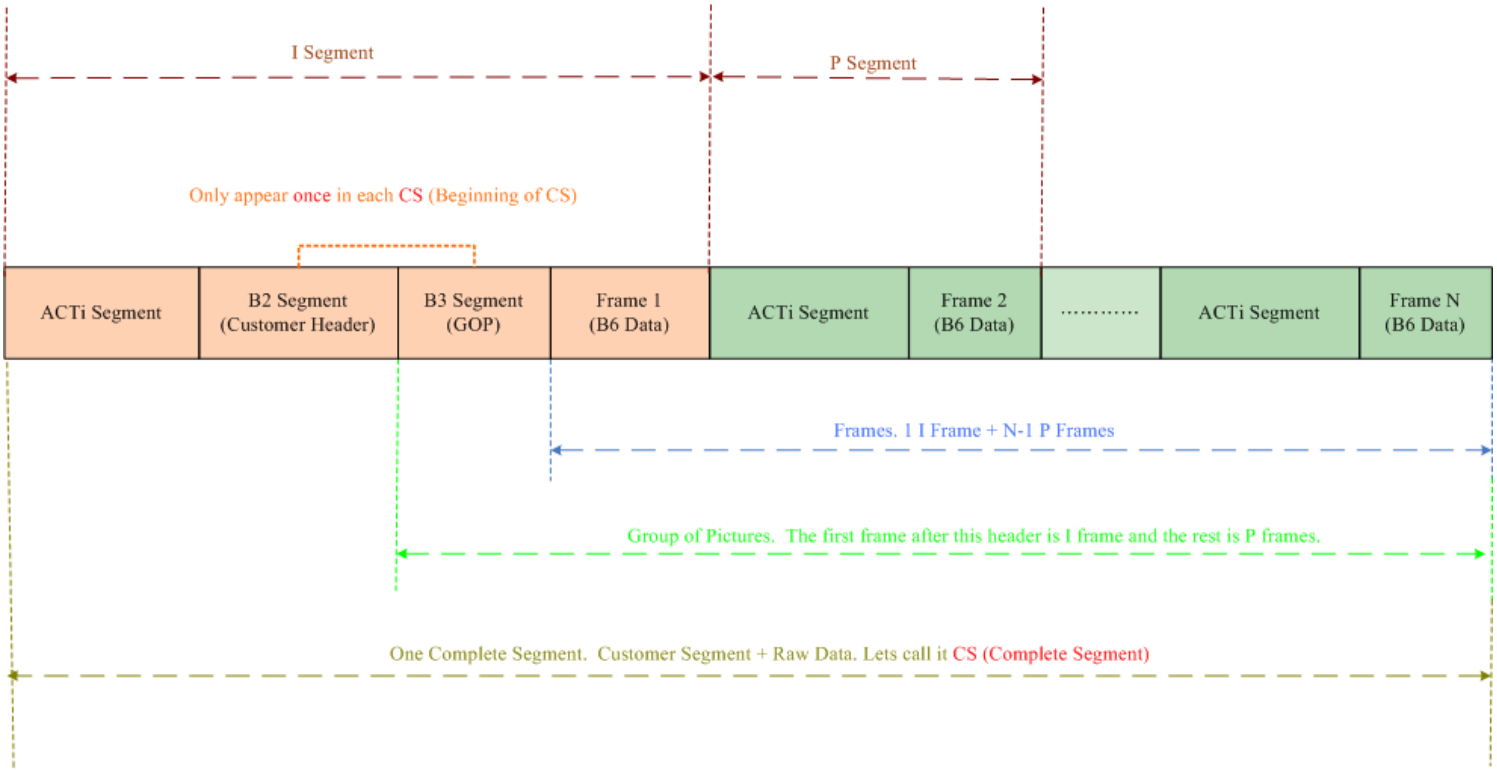
Note that:

1. Live check packet send between ATCP & Control port every constant time.

Disconnect steps

1. Disconnect register port
2. Do n and n+1 steps
3. Disconnect control port
4. Disconnect video port

TCP v1.0 Video Packet Format

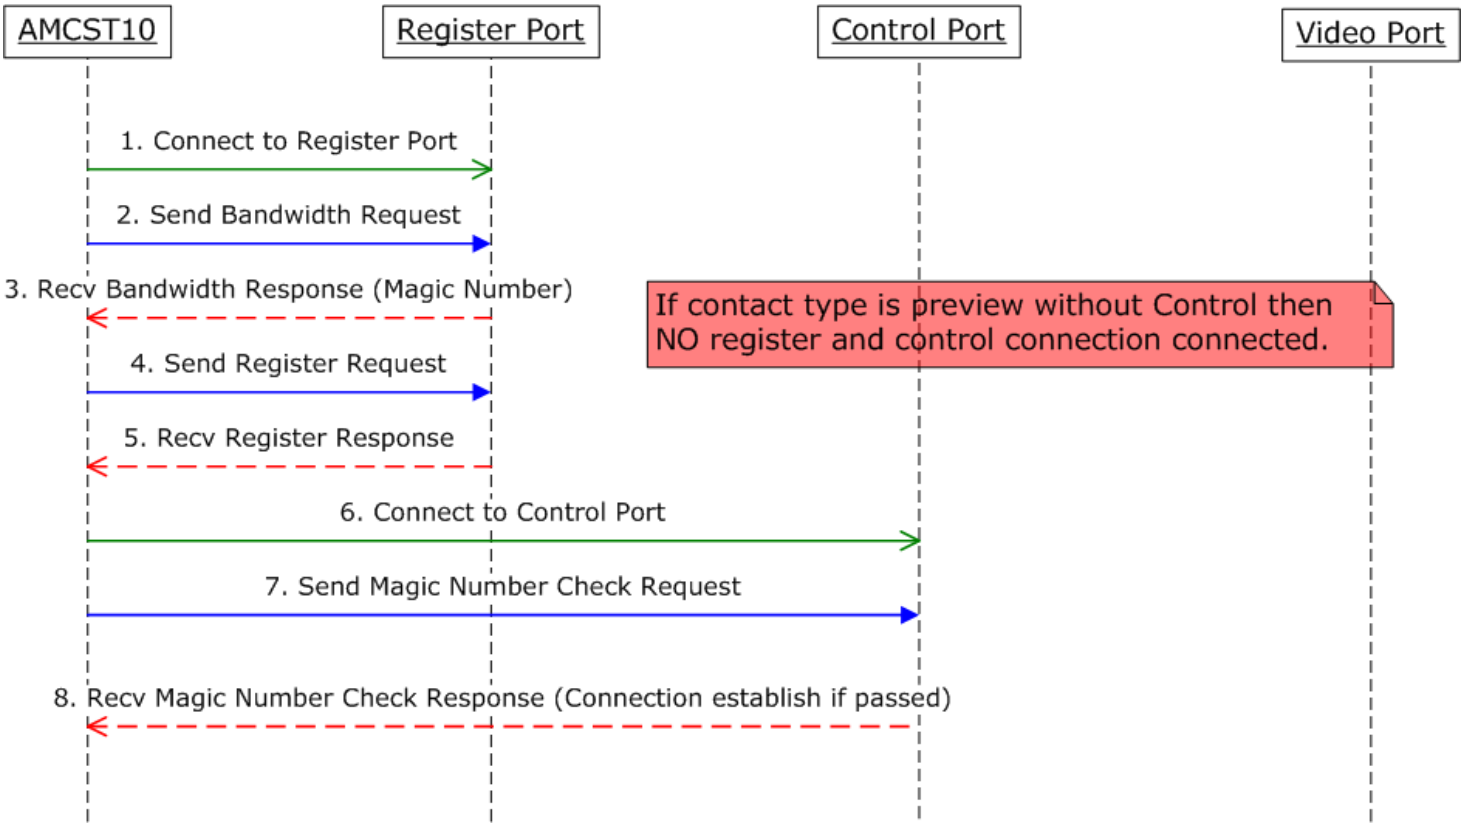


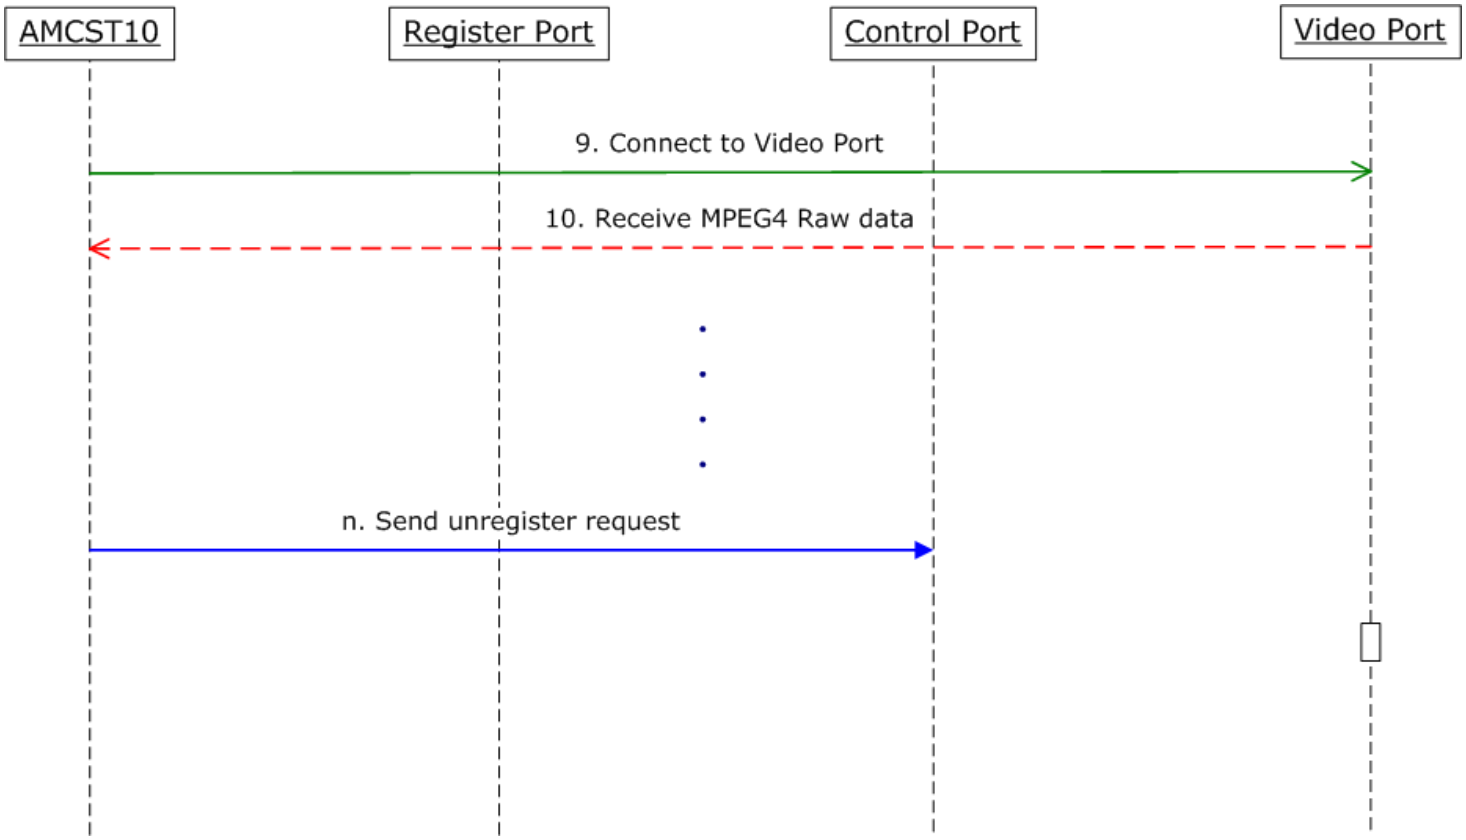
Note. No Audio data for TCP 10

```
ACTi Segment
{
char  b2h[4];   // String "ACTi"
DWORD dwVersion;  // 0x00010022
DWORD dwLength;  // Data length
}
```

Multicast v1.0 Packet

Multicast v1.0 Video Connect Flow





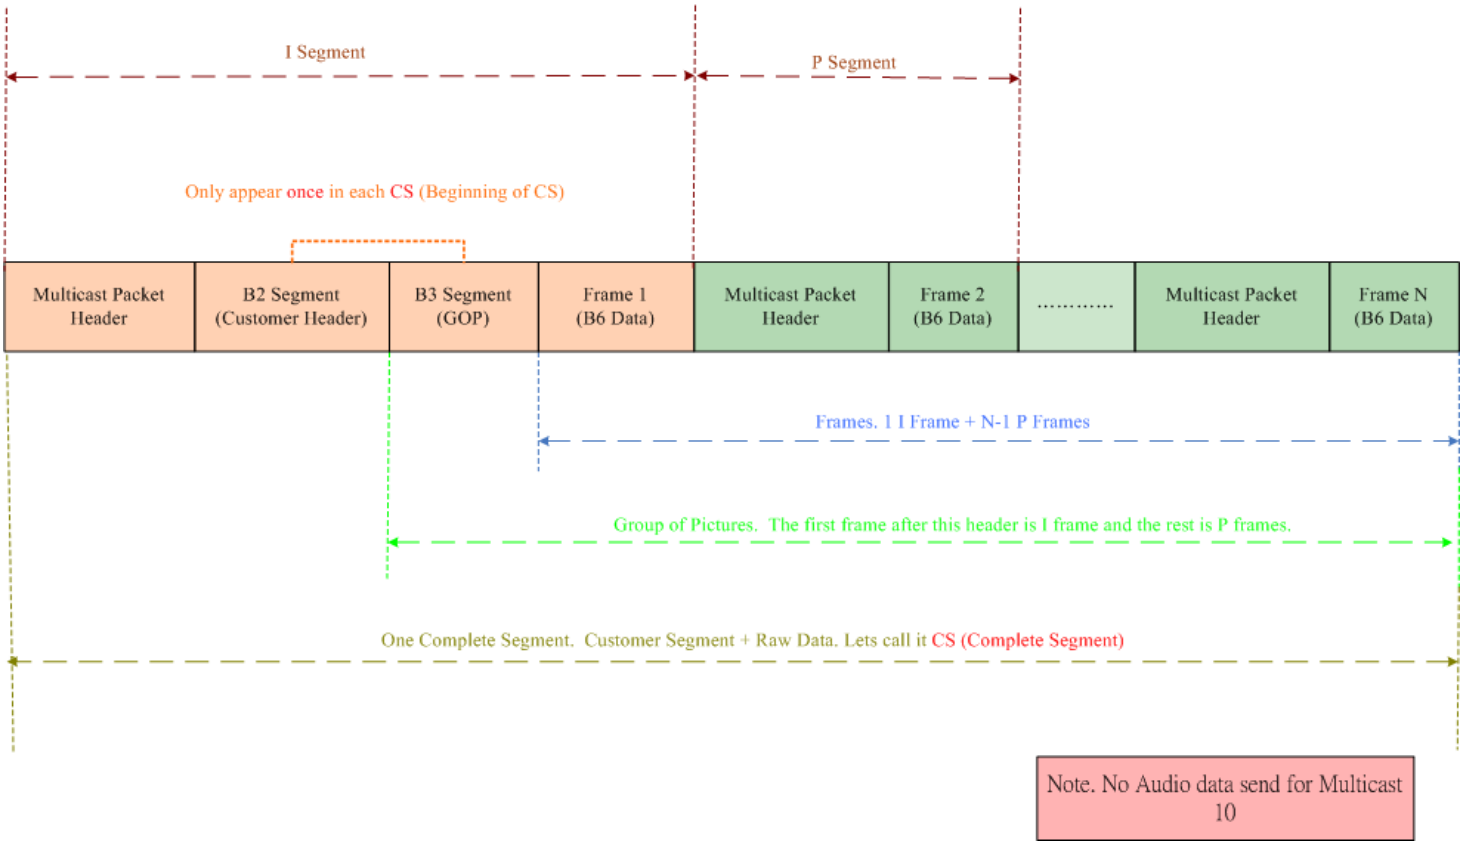
Note that:

Live check packet send between ATCP & Control port every constant time.

Disconnect steps

1. Disconnect register port
2. Do n.
3. Disconnect control port
4. Disconnect video port

Multicast v1.0 Video Packet Format



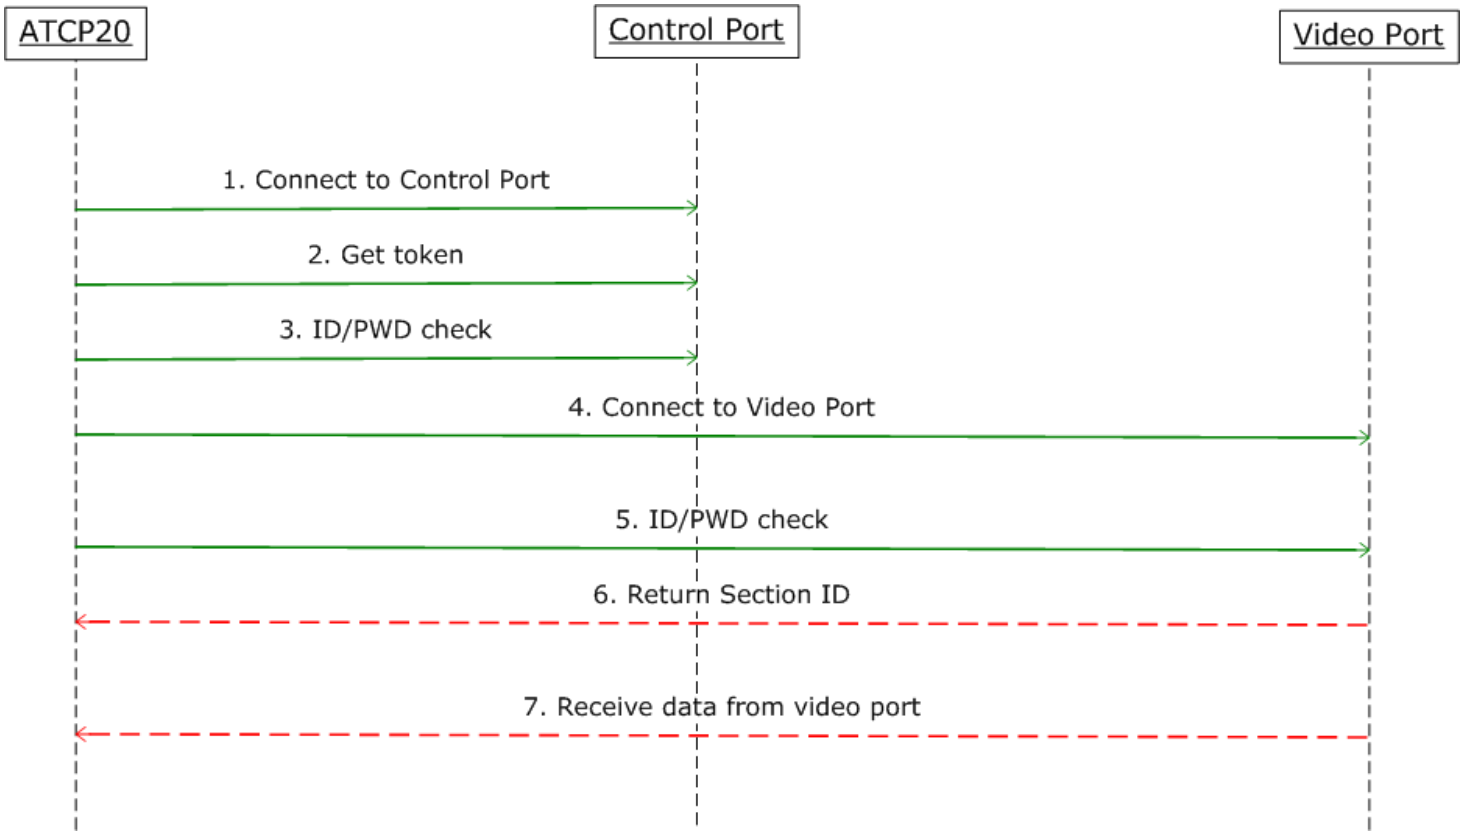
```
typedef struct tagMCPacketHead
{
unsigned char StreamId;
unsigned char StreamSubId;
unsigned char KeyPacket;
unsigned char TotalPacket;
unsigned char PacketNum;
unsigned char FrameCheckSum;
unsigned char Resolution;
unsigned char Fps;
unsigned int  FrameNum;
unsigned int  FrameLen;
} MCPacketHead;
```

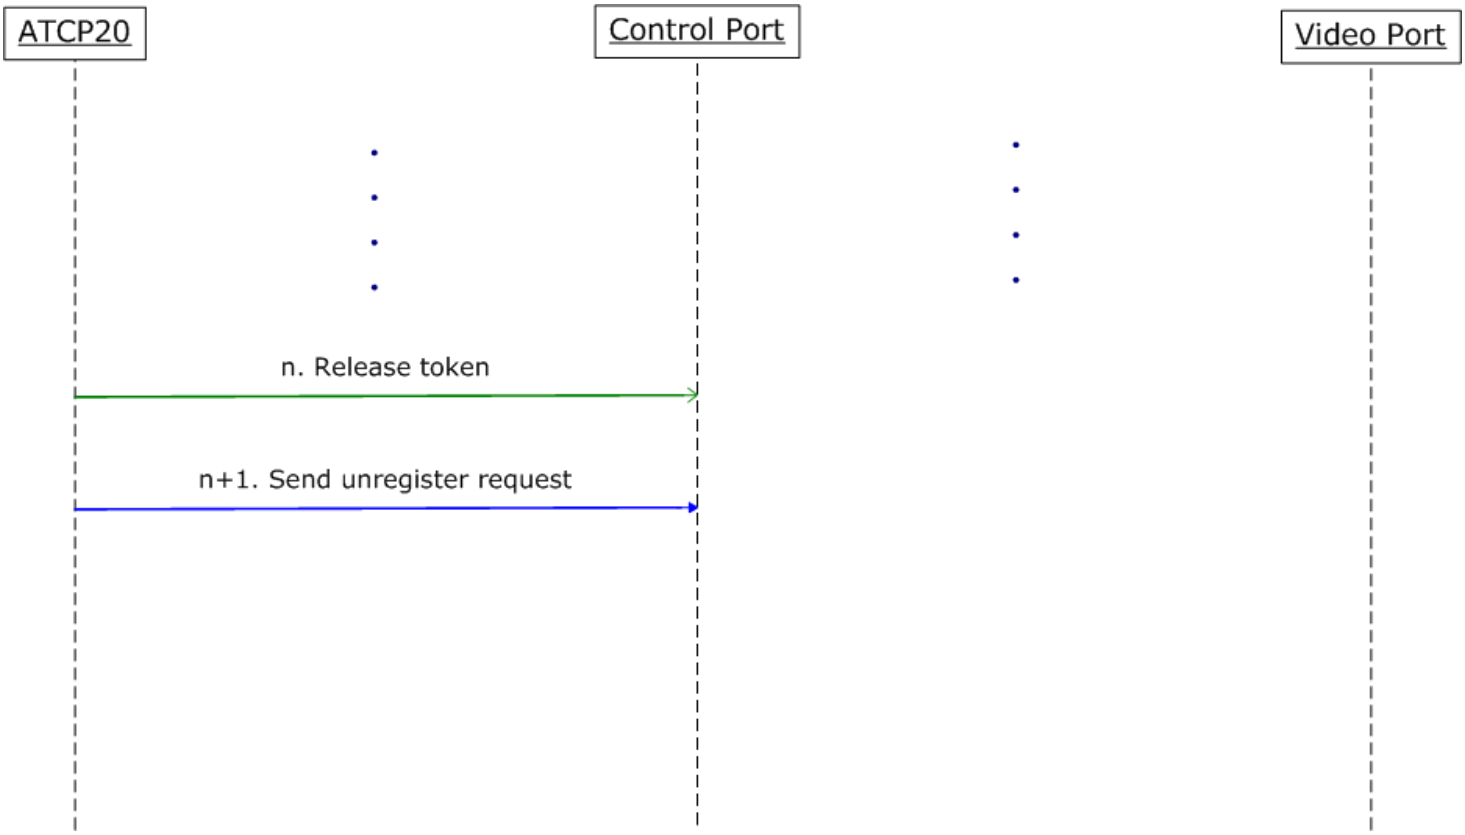
Important Note:

1. Key packet attribute is very important to determine the last packet of the frame.
2. Only key packet has both FPS and Resolution information.

TCP v2.0 Packet

TCP 2.0 Video Connect Flow

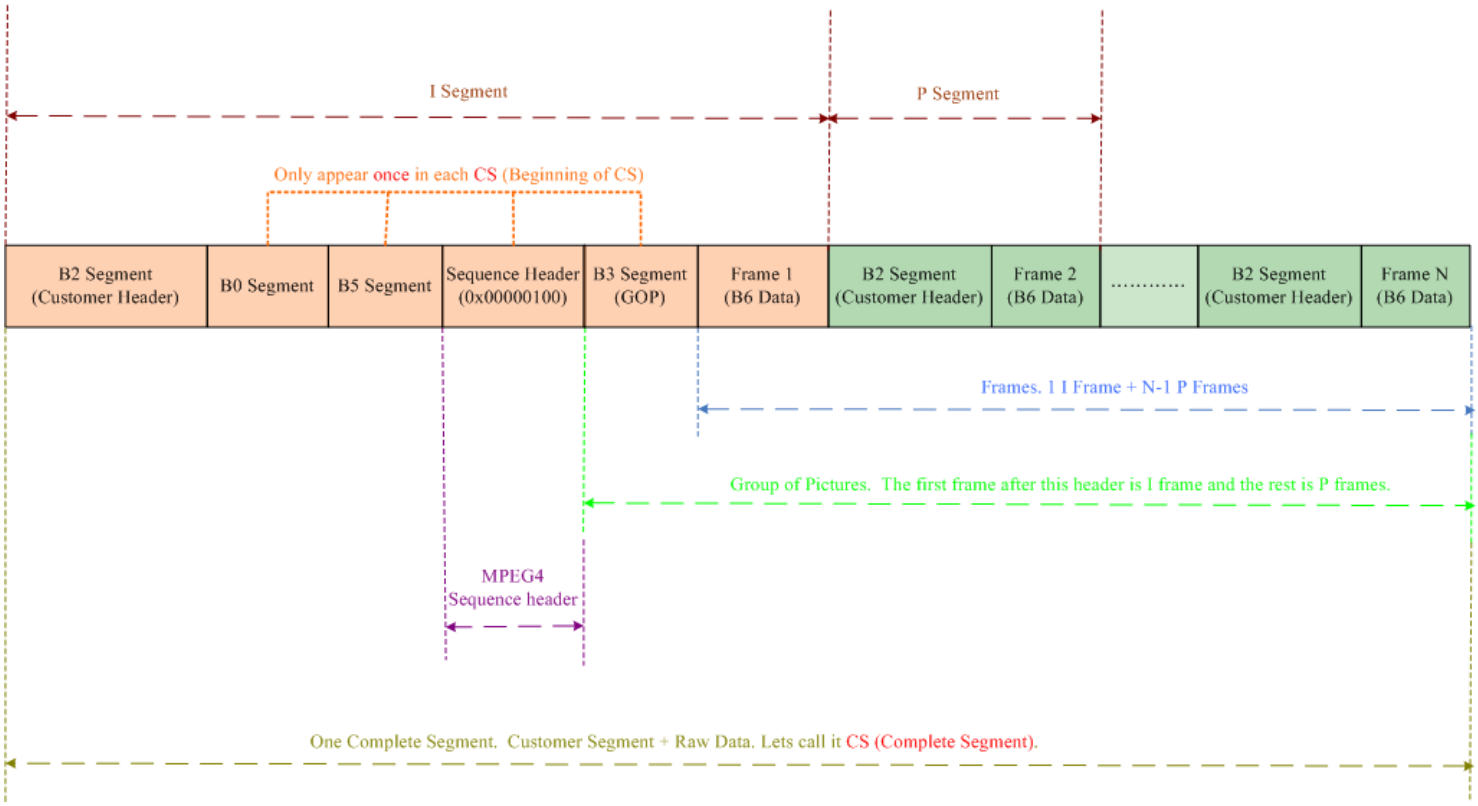




Disconnect steps

1. Do n and n+1 steps
2. Disconnect control port
3. Disconnect video port

TCP 2.0 Video Packet Format



Composition of data:

B2 Frame (see the detail in chap.8)

(B2 header is 44 Byte for MPEG4/MJPEG/H264 Frames , AUDIO_B2 header is 28 Byte)

VIDEO_B2_FRAME	
B2_HEADER	
0x000001B2	User Data

```

Multicast of ACTi :

(a) MPEG4 I Frame

Multicast Header	VIDEO_B2_FRAME		Bitstream Data					I-Frame Data			
	B2_HEADER		B0	data	B5	data	Sequence	B3	B3 Data	B6 Header	Frame data
	0x000001B2	User Data	0x000001B0	1 Byte	0x000001B5	1 Byte	0x00000100	0x0000 01B3	3 bytes	0x0000 01B6	N Byte

(b) MPEG4 P Frame

Multicast Header	VIDEO_B2_FRAME		P-Frame Data	
	B2_HEADER		B6 Header	Frame data
	0x000001B2	User Data	0x000001B6	N Byte

(c) Audio Frame

Multicast Header	AUDIO_B2		Audio Data
	B2_HEADER		(PCM data)
	0x000001B2	User Data	N Byte

Exported Struct

Media Connection Configuration :

```
typedef struct structural_MEDIA_CONNECTION_CONFIG
{
    int  ContactType;

    unsigned char ChannelNumber;
    unsigned char TCPVideoStreamID;
    unsigned char RTPVideoTrackNumber;
    unsigned char RTPAudioTrackNumber;

    char          UniCastIP[16];
    char          MultiCastIP[16];
    char          PlayFileName[256];
    char          UserID[64];
    char          Password[64];
    unsigned long RegisterPort;
    unsigned long StreamingPort;

    MJPEGCODEC                          // using Motion JPEG
    IH264CODEC                          // H.264 codec
};
```

File Write Type

```
enum FILE_WRITER_TYPES                  // File writer types
{
    FRAW,                               // Record by *.Raw File - using FRAW
    FAVI                                // Record by *.Avi File - using FAVI
};
```

Render Type

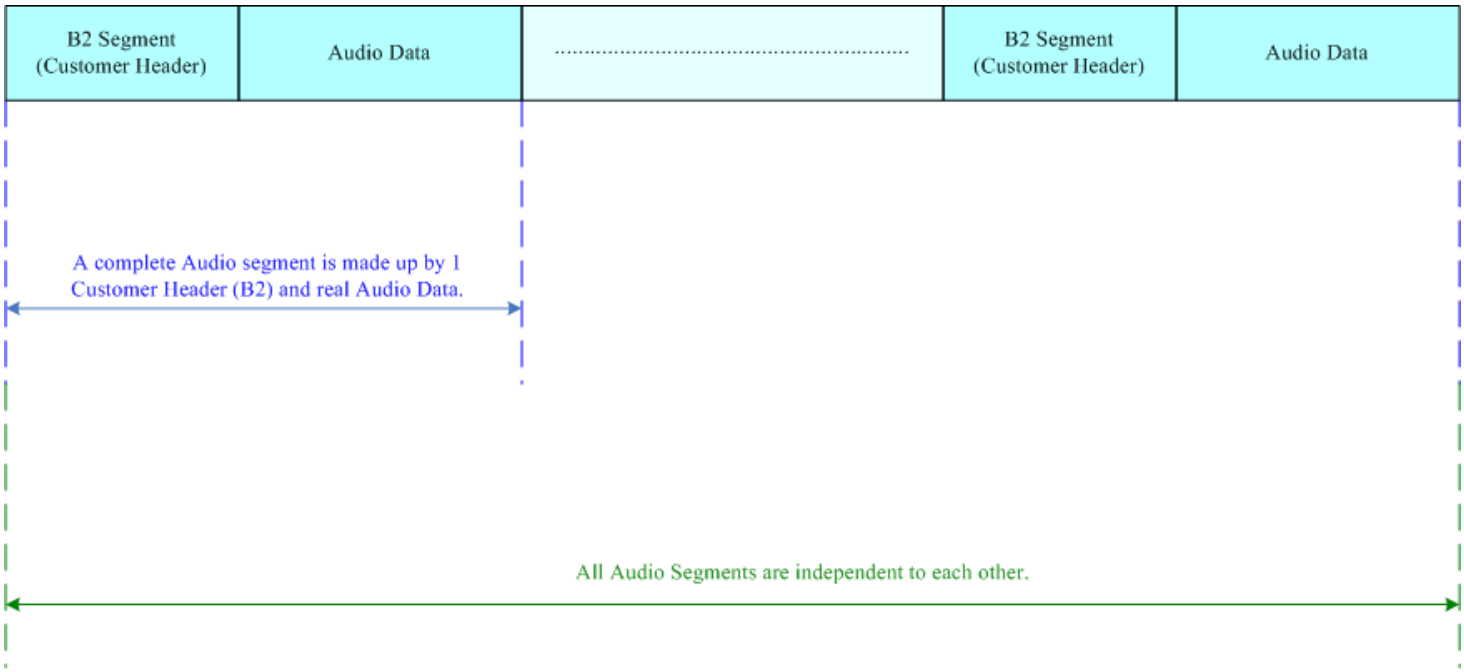
```
enum RENDER_TYPES                       // Render interface types
```

```
{
    DGDI,                                   // Windows GDI for render
    DDRAW                                   // Direct Draw for render
};
```

Device Type

```
enum DEVICE_TYPE                            // Device Type
{
    Type_None,                              // None type
    Type_StandAlong,                        // Stand along
    Type_RackMount,                         // Rack Mount
    Type_Blade                              // Blade
};
```

TCP v2.0 Audio Packet Format

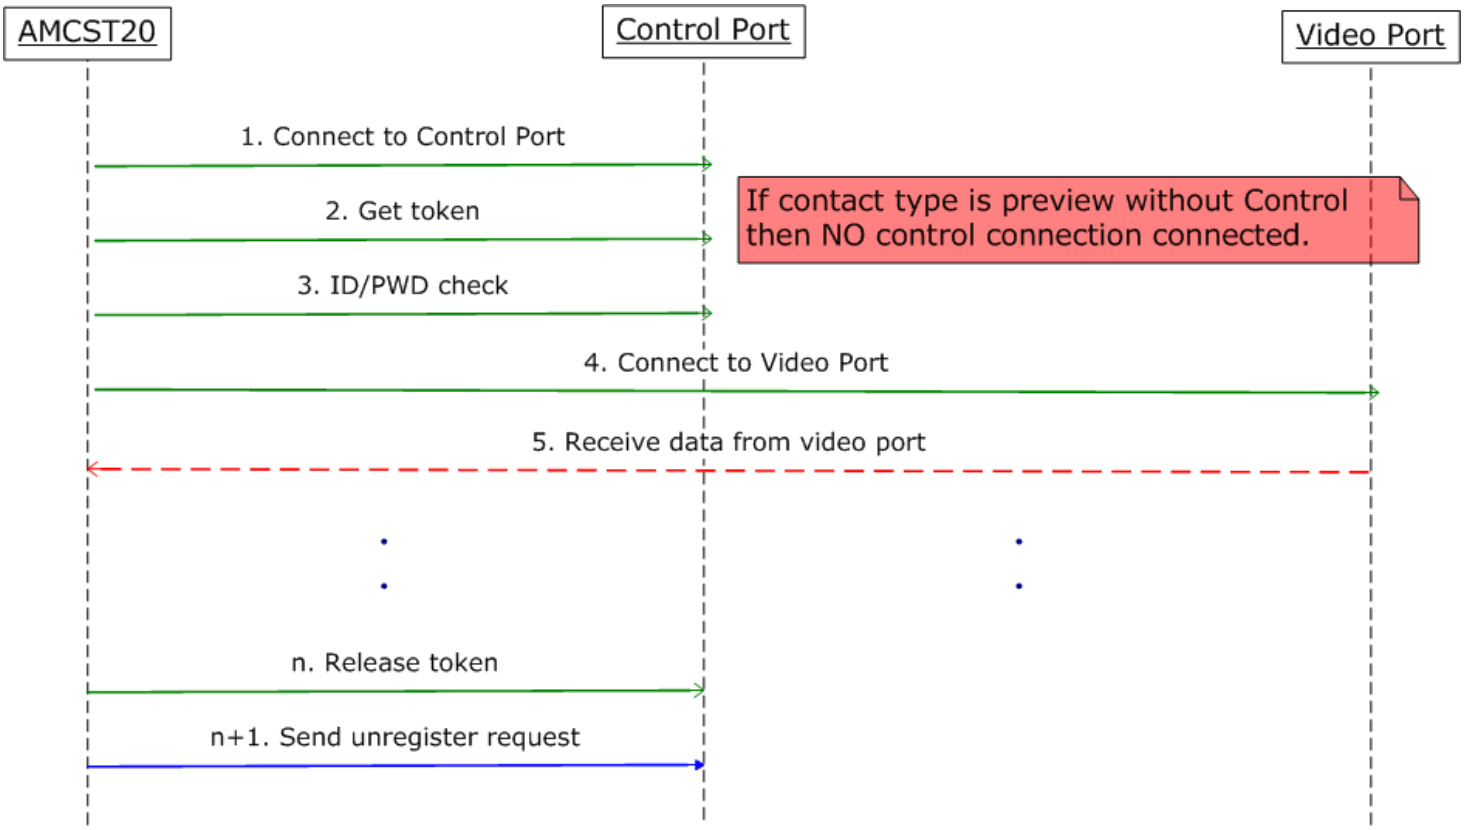


Note. Video server will send Audio & Video data in random order.

```
typedef struct {
    B2_HEADER header;
    struct timeval timestamp;
    unsigned char reserved[8];
} AUDIO_B2;    // 28 bytes (details in chapter 8)
```

Multicast v2.0 Packet

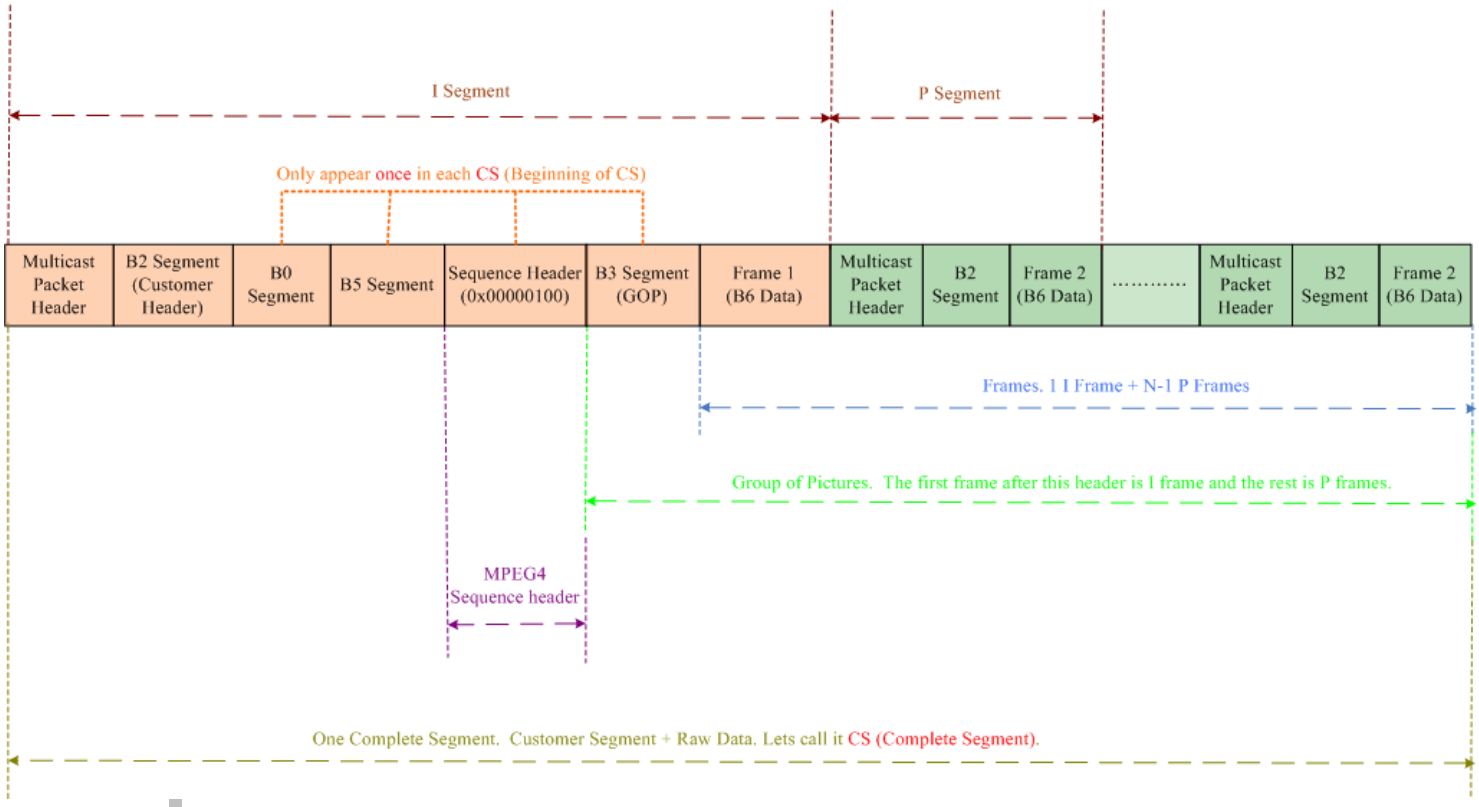
Multicast v2.0 Video Connect Flow



Disconnect steps

1. Do n.
2. Disconnect control port
3. Disconnect video port

Multicast v2.0 Video Packet Format



```
typedef struct _struct_NVDK_STRUCT_MULTICAST_HEADER
{
    unsigned char id;          /* Not used */
    unsigned char sub_id;      /* 0 -- video , 1 -- audio */
    unsigned char last;        /* 1: last packet of a frame. 0: otherwise */
    unsigned char packets;     /* This value is preserved, which is always 0*/
    unsigned char seq;         /* The sequence number in the fragmented UDP frames and
                                  started from 1 (1 ~ N), which will restart from 1 again
                                  when next frame arrived.  */
    unsigned char checksum;        /* This value is preserved, which is always 0*/
    unsigned char fpsmode_res; /* only for TCP1.0 where bit[7:4]:fps mode and
                                  bit[3:0] resolution index.
                                  for TCP2.0, this value is undefined */
    unsigned char fps_num;     /* only for TCP1.0 where bit[7:0]:fps number
```

```
                                    corresponding to the fps mode.
                                    for TCP2.0, this value is undefined. */
    unsigned int  frame_num;   /* frame counter, increased by 1. the video and audio
                                    has its own counter. */
    unsigned int  frame_len;   /* length of payload in a fragmented UDP packet. The
                                    Multicast Header is NOT included. */

}NVDK_STRUCT_MULTICAST_HEADER;
```

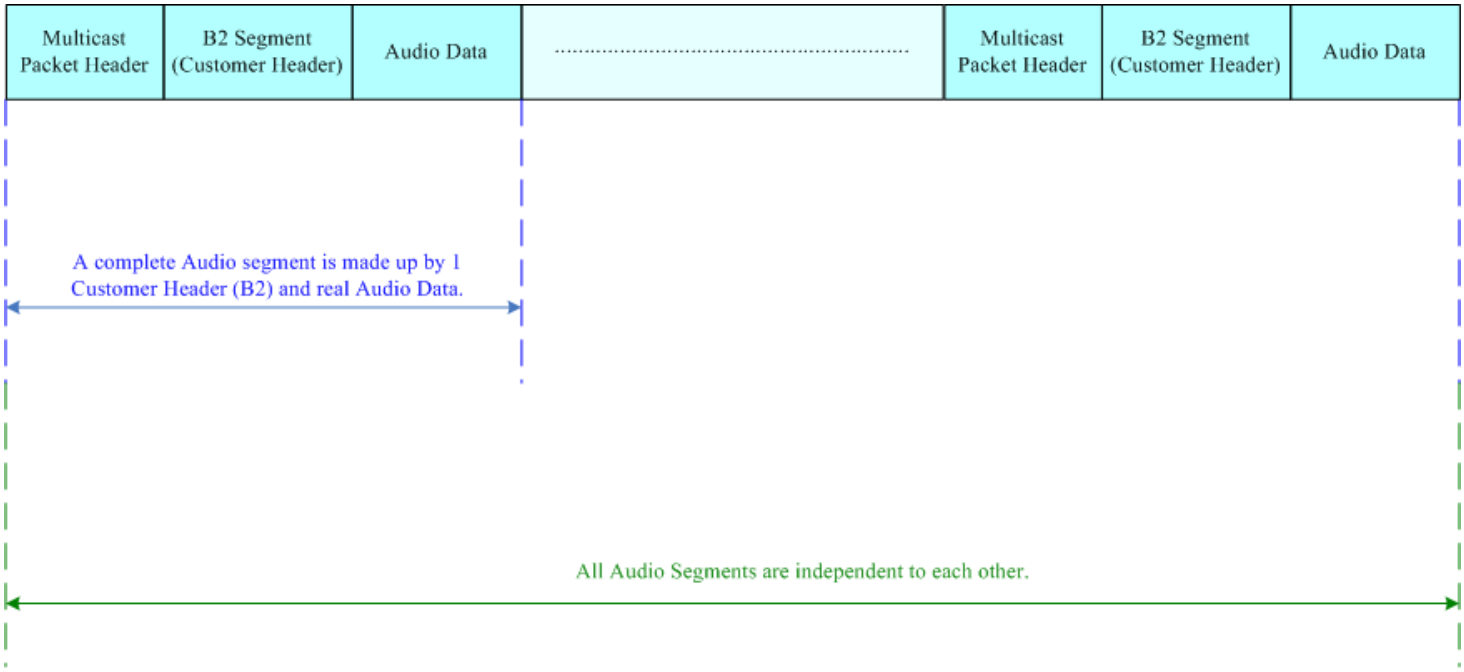
Important note:

1. Key packet attribute is very important to determine the last packet of the frame.

2. Need to find out Resolution and FPS from Sequence Header

3. 1(I or P frame) frame may divide into several multicast packets, each with a multicast packet header in front of it.

Multicast v2.0 Audio Packet Format



Note. Video server will send Audio & Video data in random order.

```
typedef struct tagMCPacketHead
{
unsigned char StreamId;
unsigned char StreamSubId;
unsigned char KeyPacket;
unsigned char TotalPacket;
unsigned char PacketNum;
unsigned char FrameCheckSum;
unsigned char Resolution;
unsigned char Fps;
unsigned int  FrameNum;
unsigned int  FrameLen;
} MCPacketHead;
```

RTP Packet Format

RTP over UDP :

12 Migration Plan from SDK-2000 to SDK-10000

SDK-10000 New Features

SDK-10000 v1.0 series contains new design architecture with following features:

- Unified SDK for IP devices (IP Camera, Video Server, IP Speed Dome, and Quad Video Server), Capture Cards, Decoder Cards, Streaming Engine and File Playback. One programming can fit all above devices.
- Superset of SDK-2000, SDK-4000 and SDK-5000
- Scalable architecture: new adaptor can be added without changing codes
- Better performance: SDK-10000 has better performance and memory management over previous SDK. It also provide shorter video latency than previous SDK
- New adaptors: Direct Draw and FAVI (record to AVI file) adaptors provided
- Multi-channel Support: Supports multiple channel devices, 2/4/8-channel video server, 4-channel capture card

SDK-2000 vs SDK-10000 Function Calls

SDK – 2000	SDK – 10000	Remark
netGetTCPMode	KGetTCPTypeByHTTP	
netOpenInterface	KOpenInterface	
netRegisterServer	KSetMediaConfig KConnect	
netInitStream	KSetRenderInfo	
netStartStream	KStartStreaming KPlay	
netSetStatusCallBack	KSetVideoLossCallback KSetVideoRecoveryCallback KSetNetworkLossCallback	
netSetMDCallBack	KSetMotionDetectionCallback

netGetOnLineUser	KGetOnLineUser	
netGetSDKVersion	KGetVersion	
netGetServerVersion	KGetServerVersion	
netRegisterServerEx	KSetMediaConfig KConnect	
netSetCommunicationPort		Not support in SDK-10000

netDecodeI	KSetDecodeIFrameOnly	
netSendURL	KSendURLCommand	
netSendCMD		Not support in SDK-10000
netCloseInterface	KCloseInterface	
netGetCameraName	KGetCameraName	
netSaveReBoot	KSaveReboot	
netGetControlToken		Not support in SDK-10000
netGetAudioToken	KGetAudioToken	
netFreeControlToken		Not support in SDK-10000
netGiveOffSound		Not support in SDK-10000
netCloseSound	KStopAudioTransfer	
netFreeAudioToken	KFreeAudioToken	
netIsMute		Not support in SDK-10000
netSetVolume	KSetVolume	
netGetVolume	KGetVolume	
netSetPreviewBuffer		Not support in SDK-10000
netSendAudio	KStartAudioTransfer	
netSetMpeg4RawCallBack2	KSetRawDataCallback	
netSetAudioRawCallBack	KSetRawDataCallback	
netSetStreamRawCallBack	KSetRawDataCallback	
netSend2StreamEngine	KSendCommandToStreamingEngine	
netMute	KSetMute	
netSetSocketSize		Not support in SDK-10000
netRegisterServerControlOnly	KSetMediaConfig KConnect	Set Contact type to CONTACT_TYPE_CONTROL_ONLY
netStartWriteInfo		Not support in SDK-10000
netStopWriteInfo		Not support in SDK-10000
netGetDeviceType	KGetDeviceTypeByHTTP	
netSetHTTPPort		Not support in SDK-10000

netSetResolutionChangeCallBack	KSetResolutionChangeCallback	
netSetChannelNumber		Not support in SDK-10000
netSetConnectTimeOut		Not support in SDK-10000

Application Migration Guide

This section describes the steps for customers to port their application from SDK-2000 to SDK-10000.

We provide 2 different step-by-step guides for following applications:

- Application that uses MPEG-4 raw data only
- Application that uses most function calls

Application that uses MPEG-4 raw data only

Steps to migrate from SDK-2000 to SDK-10000:

1. Re-compile the source codes with SDK-10000
2. Use **`KGetTCPTypeByHTTP()`** to detect if the device is compatible to TCP 1.0 format or TCP 2.0 (supports audio) format
3. Use **`KSetRawDataCallback()`** to receive both Raw-Video and Raw-Audio data.
4. Use **`KSetImageCallback()`** to get RGB buffer at the same time
5. Call **`KSendPTZCommand()`** to send PTZ commands.
6. Note that in SDK-10000, every I-Frame contains sequence header in the frame
7. Refer to Audio API for 1-way or 2-way audio functions
8. Refer to MPEG-4 data structure section for detailed MPEG-4 audio + video format

Application that uses most function calls

Steps to migrate from SDK-2000 to SDK-10000:

1. Re-compile the source codes with SDK-10000
2. Use **`KGetTCPTypeByHTTP()`** to detect if the device is compatible to TCP 1.0 format or TCP 2.0 (supports audio) format
3. Use **`KSetDecodeIFrameOnly()`** function to decode I-Frame only to save CPU utilization; this will only affect on the decoding part, recording can still record with specified frame rate
4. Call **`KSendPTZCommand()`** to send PTZ commands.
5. Refer to Audio API for 1-way or 2-way audio functions.

A APPANDIX A

How to custom a PTZ file

4.3.2008

Here we discuss how to custom a PTZ file for a camera device, and only those “important” commands are listed bellow. If you need some “minor” commands which are not described here, Please refer to the PTZ protocol files in SDK folder.

1. Attributes:

Example:
[ATTRIBUTES]
ADDRIDSTART; 0x01
ADDRIDPOS; 1
CHECKSUM; $B6=$B1^$B2^$B3^$B4^$B5
PANEL; PANTILT,MOVE,ZOOM,FOCUS,IRIS,BLC,PRESET

Description:
The “ADDRIDSTART” indicate the address ID in BYTE.
The “ADDRIDPOS” is address ID starting position. “1” is the first byte in PTZ command
The “CHECKSUM” is “HOW to calculate the checksum” and “WHERE to place the checksum”.
$B6 indicates 6th position in PTZ command.
$C5 indicates a constant ‘5’.
The defined operator is ‘+’ ‘-’ ‘*’ ‘/’ ‘^’ ‘|’ ‘&’.

If the “$D” is found in checksum string, that means no checksum should be calculated.

The “PANEL” indicates which panel you need.

2. PANTILT

Example:

[PANTILT]
PANLEFT; 1; 0;0x01,0x00,0x18,0x01,0x01,0x18
PANLEFT; 2; 0;0x01,0x00,0x18,0x01,0x02,0x1C
PANLEFT; 3; 0;0x01,0x00,0x18,0x01,0x03,0x10
PANLEFT; 4; 0;0x01,0x00,0x18,0x01,0x05,0x14
PANLEFT; 5; 0;0x01,0x00,0x18,0x01,0x07,0x17
PANLEFT; 0; 0;0x01,0x00,0x13,0x00,0x00,0x12

PANRIGHT; 1; 0;0x01,0x00,0x18,0x00,0x01,0x19
PANRIGHT; 2; 0;0x01,0x00,0x18,0x00,0x02,0x1D
PANRIGHT; 3; 0;0x01,0x00,0x18,0x00,0x03,0x11
PANRIGHT; 4; 0;0x01,0x00,0x18,0x00,0x05,0x15
PANRIGHT; 5; 0;0x01,0x00,0x18,0x00,0x07,0x16
PANRIGHT; 0; 0;0x01,0x00,0x13,0x00,0x00,0x12

TILTUP; 1; 0;0x01,0x00,0x18,0x02,0x01,0x1B
TILTUP; 2; 0;0x01,0x00,0x18,0x02,0x02,0x1F
TILTUP; 3; 0;0x01,0x00,0x18,0x02,0x03,0x13
TILTUP; 4; 0;0x01,0x00,0x18,0x02,0x05,0x17
TILTUP; 5; 0;0x01,0x00,0x18,0x02,0x07,0x14
TILTUP; 0; 0;0x01,0x00,0x14,0x00,0x00,0x15

TILTDOWN; 1; 0;0x01,0x00,0x18,0x03,0x01,0x1A
TILTDOWN; 2; 0;0x01,0x00,0x18,0x03,0x02,0x1E
TILTDOWN; 3; 0;0x01,0x00,0x18,0x03,0x03,0x12
TILTDOWN; 4; 0;0x01,0x00,0x18,0x03,0x05,0x16
TILTDOWN; 5; 0;0x01,0x00,0x18,0x03,0x07,0x15
TILTDOWN; 0; 0;0x01,0x00,0x14,0x00,0x00,0x15

PANTILTSTOP; 0; 0;0x81,0x01,0x06,0x01,0x00,0x00,0x03,0x03,0xFF

Description:

The “PANLEFT”, “PANRIGHT”, “TILTUP”, and “TILTDOWN” commands should be described here. The first parameter is the “speed”, the second parameter is reserved (0). If there is no “PANTILTSTOP” command, speed 0 must be there instead.

3. ZOOM

Example:

[ZOOM]
ZOOMIN; 1; 0;0x01,0x00,0x24,0x01,0x00,0x24
#ZOOMIN; 0; 0;
ZOOMOUT; 1; 0;0x01,0x00,0x24,0x00,0x00,0x25
#ZOOMOUT; 0; 0;
ZOOMSTOP; 0; 0;0x01,0x00,0x24,0x04,0x00,0x21

Description:

The “ZOOMIN”, “ZOOMOUT”, and “ZOOMSTOP” commands should be described here. The first parameter is 1 for “ZOOMIN” and “ZOOMOUT”, 0 for “ZOOMSTOP”.

BTW: The ‘#’ mark the line disabled.

4. FOUCUS

Example:

[FOCUS]
FOCUSIN; 1; 0;0x81,0x01,0x04,0x08,0x03,0xFF
FOCUSOUT; 1; 0;0x81,0x01,0x04,0x08,0x02,0xFF
FOCUSSTOP; 0; 0;0x81,0x01,0x04,0x08,0x00,0xFF

Description:

The “FOCUSIN”, “FOCUSOUT”, and “FOCUSSTOP” commands should be described here. The first parameter is 1 for “FOCUSIN” and “FOCUSOUT”, 0 for “FOCUSSTOP”.

5. IRIS

Example:

[IRIS]
IRISOPEN;1;0;0x81,0x01,0x04,0x0B,0x02,0xFF
IRISSTOP;0;0;0x81,0x01,0x04,0x0B,0x00,0xFF
IRISCLOSE;1;0;0x81,0x01,0x04,0x0B,0x03,0xFF

Description:

The “IRISOPEN”, “IRISCLOSE”, and “IRISSTOP” commands should be described here. The first parameter is 1 for “IRISOPEN” and “IRISCLOSE”, 0 for “IRISSTOP”.

6. PRESET

Example:

[PRESET]
PRESETGOTO;1;0;0x81,0x01,0x04,0x3F,0x02,0x00,0xFF
PRESETGOTO;2;0;0x81,0x01,0x04,0x3F,0x02,0x01,0xFF
PRESETGOTO;3;0;0x81,0x01,0x04,0x3F,0x02,0x02,0xFF
PRESETGOTO;4;0;0x81,0x01,0x04,0x3F,0x02,0x03,0xFF
PRESETGOTO;5;0;0x81,0x01,0x04,0x3F,0x02,0x04,0xFF
PRESETGOTO;6;0;0x81,0x01,0x04,0x3F,0x02,0x05,0xFF
PRESETSET;1;0;0x81,0x01,0x04,0x3F,0x01,0x00,0xFF
PRESETSET;2;0;0x81,0x01,0x04,0x3F,0x01,0x01,0xFF
PRESETSET;3;0;0x81,0x01,0x04,0x3F,0x01,0x02,0xFF
PRESETSET;4;0;0x81,0x01,0x04,0x3F,0x01,0x03,0xFF
PRESETSET;5;0;0x81,0x01,0x04,0x3F,0x01,0x04,0xFF
PRESETSET;6;0;0x81,0x01,0x04,0x3F,0x01,0x05,0xFF
PRESETCLEAR;1;0;0x81,0x01,0x04,0x3F,0x00,0x00,0xFF
PRESETCLEAR;2;0;0x81,0x01,0x04,0x3F,0x00,0x01,0xFF
PRESETCLEAR;3;0;0x81,0x01,0x04,0x3F,0x00,0x02,0xFF
PRESETCLEAR;4;0;0x81,0x01,0x04,0x3F,0x00,0x03,0xFF
PRESETCLEAR;5;0;0x81,0x01,0x04,0x3F,0x00,0x04,0xFF
PRESETCLEAR;6;0;0x81,0x01,0x04,0x3F,0x00,0x05,0xFF

PRESETTOUR;1;0;0x01,0x00,0x11,0x01,0x00,0x11

Description:

The “PRESETCLEAR”, “PRESETGOTO” and “PRESETSET” define preset positions. The

“PRESETSET” is adding a preset position. The “PRESETCLEAR” is removing a preset position. The “PRESETGOTO” make camera moving to one preset position. The first parameter is the ID of a preset position, second parameter is reserved (0). If there is a command to make camera touring every preset position, describe it behind “PRESETTOUR”.

7. OSD

Example:

[OSD]
OSDON; 0; 0;0x01,0x00,0x28,0x04,0x00,0x2D
#OSDOFF; 0; 0;0x01,0x00,0x28,0xFF,0x00,0xD6
OSDUP; 0; 0;0x01,0x00,0x28,0x00,0x00,0x29
OSDDOWN; 0; 0;0x01,0x00,0x28,0x01,0x00,0x28
OSDLEFT; 0; 0;0x01,0x00,0x28,0x02,0x00,0x2B
OSDRIGHT; 0; 0;0x01,0x00,0x28,0x03,0x00,0x2A
OSDENTER; 0; 0;0x01,0x00,0x28,0x04,0x00,0x2D
OSDLEAVE; 0; 0;0x01,0x00,0x28,0xFF,0x00,0xD6
#OSDSTOP; 0; 0;0xA0,0x00,0x00,0x00,0x00,0x00,0xAF,0x00

Description:

The [OSD] section defined how to operate OSD functions. There are 9 definitions for OSD actions.

Authentication Sample in RTP/RTSP

Notify: 1.The EOL of SDP header is \r\n

2.Every EOL of content is possible \r\n or \n. (Total length match with content-length)
